# 1 Introduction

25

34

We investigate the computational meaning of the following *switch* rule of deep-inference proof theory [22, 13]:

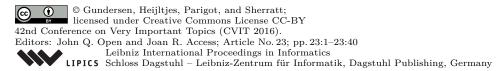

$$\frac{(A \to B) \land C}{A \to (B \land C)}^{s}$$

On its own, it corresponds to an *end-of-scope* marker in  $\lambda$ -calculus. This is a special annotation of a subterm, to indicate that a given variable does not occur free, so that a substitution on that variable can be aborted early. In the above rule, A corresponds to the binding variable of an abstraction and C to the subterm of said abstraction where it doesn't occur, while B represents those subterms where it does occur.

The main thrust of our work is to incorporate this rule, and its computational interpretation as a term construct, into the *atomic*  $\lambda$ -calculus [14]. This calculus results from an investigation of the following *medial* rule:

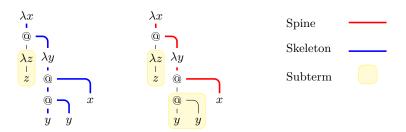

$$\frac{(A \lor B) \to (C \land D)}{(A \to C) \land (B \to D)}^{m}$$

The medial rule enables duplication to proceed atomically: on individual constructors (abstraction and application) rather than entire subterms. The atomic  $\lambda$ -calculus implements full laziness, a standard notion of sharing where only the skeleton of a term needs to be duplicated. Given a term t which needs to be duplicated, full laziness allows to share all maximal subterms  $u_1, \ldots, u_k$  of t that do not contain occurrences of a variable bound in t outside  $u_i$ . The constructors in t not in any  $u_i$  are then part of the skeleton.

#### 23:2 Spinal Atomic Lambda-Calculus

Our investigation is then focused on the interaction of switch and medial. Based on this we develop the *spinal atomic*  $\lambda$ -calculus, a natural evolution of the atomic  $\lambda$ -calculus. The new calculus duplicates the *spine* rather than the skeleton. The spine of an abstraction are the direct paths from the binder to bound variables (terminology taken from [3]). The graph below provides an example of this for the term  $\lambda x.(\lambda z.z)\lambda y.(yy)x$ , where the spine of  $\lambda x$  is the very thick red line and the largest subterms that could be identied by an end-of-scope operator in the term calculus (or the switch rule in the proof theory) are enclosed in boxes.

In Section 2 introduces a simple sharing calculus that we expand on in Section 3, where we introduce the syntax and semantics of the spinal atomic  $\lambda$ -calculus, and its typing system. In Section 4 we further study the reduction rules that allow for spinal duplication, and prove natural properties of these rules such as termination and confluence. In Section 5 we extend these results to include beta reduction, and show preservation of strong normalisation with respect to the  $\lambda$ -calculus. We conclude in Section 6.

#### 1.1 Related Work

Spine duplication has been implemented by Blanc et al. in [7], by making use of labels in a dag-implementation. The main purpose of their work is to study sharing in Wadsworth's weak  $\lambda$ -calculus [24] (further studied in [9]). Balabonski [3] showed that spine duplication allows for an optimal reduction in the sense of Lévy [20] for weak reduction i.e. where a  $\beta$ -reduction  $(\lambda x.t)s$  occurring in a subterm u can only reduce if all free variables in the redex are also free in the term u. Blelloch and Greiner [8] showed that the weak call-by-value reduction strategy can be implemented in polynomial time with respect to the size of the initial term and the number of  $\beta$  steps in said term. Given the restriction that u is a closed term, this is then the same as closed reduction [10, 11]. Our work generalizes spine duplication to the  $\lambda$ -calculus. It uses environments to implement sharing, and does not make use of labels, while maintaining a close intuition to dag-implementations.

End-of-scope markers in the  $\lambda$ -calculus have been seen throughout literature. Berkling's lambda bar [5] has shown to remove the need for variable names while maintaining correctness; improving efficiency by removing the need for alpha conversion [6]. This result was generalized by Adbmal (invert of "Lambda") [16]. It was shown by using multiple variables, scopes can be sequenced rather than nested which correspond closely to the boxes in MELL proof nets of linear logic [19]. This approach was studied further in [23] as graph reduction that satisfies optimality [20]. Although these approaches could identify the skeleton of a term, none however identify the spine of a term, which meant the scopes explicitly displayed may be larger than necessary from the perspective of performing substitution. This problem was solved by director strings, introduced by Kennaway and Sleep in [17] for combinator reduction and then generalized for any strategy by Fernández et al. in [12]. Director strings are an annotation on terms detailing the location of variable occurrences. An apt annotation on the body of an abstraction will consequently identify the spine of it. Despite being implementations

that use director strings [21, 12, 11], an implementation with sharing techniques allowing for duplicating solely the spine could not be found.

# **2** Typing a $\lambda$ -calculus in open deduction

A derivation from a premise formula X to a conclusion formula Z is constructed inductively as in Figure 1a, with from left to right: a propositional atom a, where X = Z = a; horizontal composition with a connective \*, where  $X = X_1 * X_2$  and  $Z = Z_1 * Z_2$ ; and rule composition, where r is an inference rule from  $Y_1$  to  $Y_2$ . The boxes serve as parentheses (since derivations extend in two dimensions) and may be omitted. Derivations are considered up to associativity of rule composition. One may consider formulas as derivations that omit rule composition; and the binary \* may be generalised to 0-ary, unary, and n-ary operators. Vertical composition of a derivation from X to Y and one from Y to Z, depicted by a dashed line, is a defined operation, given in Figure 1b.

$$\begin{array}{c}
X \\
\downarrow \\
Z
\end{array} ::= a \mid \begin{array}{c}
X_1 \\
\downarrow \\
Z_1
\end{array} * \begin{array}{c}
X_1 \\
\downarrow \\
Z_1
\end{array} * \begin{array}{c}
X \\
\downarrow \\
Y_1
\end{array} = \begin{array}{c}
X \\
\downarrow \\
Z
\end{array} = \begin{array}{c}
X \\
\downarrow \\
Z
\end{array} = \begin{array}{c}
X_1 \\

Y_1
\end{array} = \begin{array}{c}
X_2 \\
\downarrow \\
Y_1
\end{array} = \begin{array}{c}
X_2 \\
\downarrow \\
Y_1
\end{array} = \begin{array}{c}
X_2 \\
\downarrow \\
Y_2
\end{array} = \begin{array}{c}
X_1 \\
\downarrow \\
X_2
\end{array} = \begin{array}{c}
X_1 \\
X_2
\end{array} =$$

(a) Derivations

(b) Vertical composition

A system for intuitionistic logic is given by the binary connectives  $\rightarrow$ ,  $\wedge$ , and nullary connective  $\uparrow$ , where we restrict implication to a form in Figure 2a, and the inference rules in Figure 2b. We work modulo associativity, symmetry, and unitality of conjunction, justifying the *n*-ary contraction, and may omit  $\uparrow$  from the axiom rule. A 0-ary contraction, with conclusion  $\uparrow$ , is a weakening. Figure 2c: the abstraction rule ( $\lambda$ ) is derived from axiom and switch.

$$Y \rightarrow \bigvee_{Z}^{X} \qquad \frac{X}{X \rightarrow X} \stackrel{a}{\longrightarrow} \frac{(X \rightarrow Y) \wedge X}{Y} \stackrel{@}{\longrightarrow} \qquad \frac{X}{X \wedge \cdots \wedge X} \stackrel{\triangle}{\longrightarrow} \frac{(X \rightarrow Y) \wedge Z}{X \rightarrow (Y \wedge Z)} \stackrel{s}{\longrightarrow} \qquad \frac{X}{Y \rightarrow (X \wedge Y)} \stackrel{\lambda}{\longrightarrow} ::= \frac{\bigvee_{Y \rightarrow Y}^{T} \stackrel{a}{\longrightarrow} \wedge X}{Y \rightarrow (X \wedge Y)} \stackrel{s}{\longrightarrow} (\mathbf{c}) \text{ Abstraction}$$
(a) Implication traction, and Switch (c) Abstraction

### <sub>27</sub> 2.1 The Sharing Calculus

Our starting point is the *sharing calculus* ( $\Lambda^S$ ), a calculus with an explicit sharing construct, similar to explicit substitution [1].

▶ **Definition 1.** The pre-terms r, s, t and sharings  $[\Gamma]$  of the  $\Lambda^S$  are defined by:

$$s,t := x \mid \lambda x.t \mid st \mid u[\Gamma] = [\Gamma] := [x_1,\ldots,x_n \leftarrow s]$$

with from left to right: a variable; an abstraction, where x occurs free in t and becomes bound; an application, where t and s use distinct variable names; and a closure; in  $u[\vec{x} \leftarrow s]$ 

the variables in the vector  $\vec{x} = x_1, \dots, x_n$  all occur in t and become bound, and t and s use distinct variable names. Terms are pre-terms modulo permutation equivalence ( $\sim$ ):

$$t[\vec{x} \leftarrow s][\vec{y} \leftarrow r] \sim t[\vec{y} \leftarrow r][\vec{x} \leftarrow s] \qquad (\{\vec{y}\} \cap (s)_{fv} = \{\})$$

A term is in sharing normal form if all sharings occur as  $[\vec{x} \leftarrow x]$  either at the top level or directly under a binding abstraction, as  $\lambda x.t[\vec{x} \leftarrow x]$ .

Note that variables are *linear*: variables occur at most once, and bound variables must occur.

A vector  $\vec{x}$  has length  $|\vec{x}|$  and consist of the variables  $x_1, \ldots, x_{|\vec{x}|}$ . An *environment* is a sequence of sharings  $[\Gamma] = [\Gamma_1] \ldots [\Gamma_n]$ . Substitution is written  $\{x/t\}$ , and  $\{t_1/x_1\} \ldots \{t_n/x_n\}$  may be abbreviated to  $\{t_i/x_i\}_{i\in[n]}$ .

▶ **Definition 2.** The interpretation of a term t to the  $\lambda$ -term  $\llbracket t \rrbracket$  given as follows

$$[\![x]\!] = x \quad [\![\lambda x.t]\!] = \lambda x.[\![t]\!] \quad [\![st]\!] = [\![s]\!] [\![t]\!] \quad [\![t[\vec{x} \leftarrow s]\!]\!] = [\![t]\!] \{[\![s]\!]/x_i\}_{i \in [n]}$$

The translation (N) of a  $\lambda$ -term N is the unique sharing-normal term t such that N = [t].

A term t will be typed by a derivation with restricted types, as shown below, where the context type  $\Gamma = A_1 \wedge \cdots \wedge A_n$  will have an  $A_i$  for each free variable  $x_i$  of t. We connect free variables to their premises by writing  $A^x$  and  $\Gamma^{\vec{x}}$ . The  $\Lambda^S$  is then typed as in Figure 3.

Basic Types:  $A, B, C := a \mid A \to B$  Context Types:  $\Gamma, \Delta := A \mid \tau \mid \Gamma \land \Delta$ 

$$x:A^{x} \qquad ts: \underbrace{\begin{bmatrix} \Gamma \\ \downarrow t \\ A \to B \end{bmatrix}}_{B} \wedge \underbrace{\begin{bmatrix} \Delta \\ \downarrow s \\ A \end{bmatrix}}_{@} \qquad \lambda x.t: \underbrace{A \to \begin{bmatrix} \Gamma \wedge A^{x} \\ \downarrow t \\ B \end{bmatrix}}_{} \wedge \underbrace{\begin{bmatrix} \Gamma \wedge A^{x} \\ \downarrow t \\ B \end{bmatrix}}_{} \wedge \underbrace{\begin{bmatrix} \Gamma \wedge A^{x} \\ \downarrow t \\ B \end{bmatrix}}_{} \wedge \underbrace{\begin{bmatrix} \Lambda \\ \downarrow s \\ A \wedge \cdots \wedge A \\ \downarrow t \\ \end{bmatrix}}_{}$$

### **3** The Spinal Atomic $\lambda$ -Calculus

We now formally introduce the syntax of the spinal atomic  $\lambda$ -calculus ( $\Lambda_a^S$ ), by extending the definition of the sharing calculus in Definition 1 with a *distributor* construct that allows for atomic duplication of terms.

**Definition 3** (Pre-Terms). The pre-terms r, s, t, closures  $[\Gamma]$ , and environments  $\overline{[\Gamma]}$  of the  $\Lambda_a^S$  are defined by:

$$t \ \coloneqq \ x \ | \ st \ | \ x\langle \vec{y} \rangle . t \ | \ t[\Gamma]$$
 
$$[\Gamma] \ \coloneqq \ [\vec{x} \leftarrow t] \ | \ [e_1\langle \vec{x_1} \rangle \dots e_n\langle \vec{x_n} \rangle | d\langle \vec{y} \rangle [\overline{\Gamma}]] \qquad [\overline{\Gamma}] \ \coloneqq \ [\Gamma] \ | \ [\overline{\Gamma}][\Gamma]$$

First note that we denote abstractions such that  $\lambda x.t \equiv x\langle x \rangle.t$ . We introduce a new notion of abstraction called *phantom-abstraction*, which can be intuitively be thought of as a partially duplicated abstraction. An abstraction  $x\langle x \rangle.t$  and a phantom-abstraction  $x\langle \vec{y} \rangle.t$  are two instances of the same construct. We call the variables inside the brackets the *cover* of

the abstraction. If the cover is the same as the preceding variable, then it is an abstraction, otherwise it is a phantom-abstraction and we call the preceding variable a *phantom-variable*.

The distributor  $u[e_1\langle \vec{x_1}\rangle \dots e_n\langle \vec{x_n}\rangle | d\langle \vec{y}\rangle [\Gamma]]$  captures the phantom-variables  $e_1, \dots, e_n$  in u and the covers associated with those phantom-variables are captured by the environment  $\overline{[\Gamma]}$ . We sometimes write the distributor as  $u[\overline{e\langle x\rangle} | d\langle \vec{y}\rangle \overline{[\Gamma]}]$  when we are not concerned about the binding of phantom-variables. Terms are then pre-terms with sensible and correct bindings. To define terms, we first define *free* and *bound* variables and phantom variables.

▶ **Definition 4** (Free and Bound Variables). The free variables  $(-)_{fv}$  and bound variables  $(-)_{bv}$  of a pre-term t is defined as follows

$$(x)_{fv} = \{x\}$$

$$(x)_{bv} = \{\}$$

$$(st)_{fv} = (s)_{fv} \cup (t)_{fv}$$

$$(st)_{bv} = (s)_{bv} \cup (t)_{bv}$$

$$(x\langle x\rangle.t)_{fv} = (t)_{fv} - \{x\}$$

$$(z\langle x\rangle.t)_{bv} = (t)_{bv} \cup \{x\}$$

$$(z\langle x\rangle.t)_{fv} = (t)_{fv}$$

$$(z\langle x\rangle.t)_{bv} = (t)_{bv} \cup \{x\}$$

$$(z\langle x\rangle.t)_{bv} = (z\rangle_{bv} \cup \{z\}$$

$$(z\langle x\rangle.t)_{bv} = (z\rangle_{bv} \cup \{z\rangle_{bv} \cup \{z$$

▶ **Definition 5** (Free and Bound Phantom-Variables). The free phantom-variables  $(-)_{fp}$  and bound phantom-variables  $(-)_{bp}$  of the pre-term t is defined as follows

$$(x)_{fp} = \{\}$$

$$(x)_{bp} = \{\}$$

$$(x)_{bp} = \{\}$$

$$(x)_{bp} = \{\}$$

$$(x)_{bp} = (x)_{bp} \cup (x)_{bp}$$

$$(x \cup x)_{bp} \cup (x)_{bp}$$

Variables are bound by abstractions (not phantoms) and sharings. Phantom-variables are bound by distributors. With these definitions, we can formally define the terms of  $\Lambda_a^S$ .

- **Definition 6** (Terms). A term  $t \in \Lambda_a^S$  is a pre-term with the following constraints
  - 8 1. Each variable may occur at most once.
    - **2.** In an abstraction  $x\langle x \rangle .t$ ,  $x \in (t)_{fv}$ .

164

165

- **3.** In a phantom-abstraction  $c(x_1,\ldots,x_n).t$ ,  $\{x_1,\ldots,x_n\} \subset (t)_{fv}.$
- **4.** In a sharing  $u[x_1, ..., x_n \leftarrow t], \{x_1, ..., x_n\} \subset (u)_{fv}$ .
- 5. In a distributor  $u[e_1\langle w_1^1,\ldots,w_{k_1}^1\rangle\ldots e_n\langle w_1^n,\ldots,w_{k_n}^n\rangle|c\langle c\rangle\overline{[\Gamma]}]$ 
  - **a.** For all  $1 \le i \le n$  and  $1 \le m \le k_n$ ,  $w_m^i(u)_{fv}$  and becomes bound by  $\overline{[\Gamma]}$ .
  - **b.**  $\{e_1\langle w_1^1,\ldots,w_{k_1}^1\rangle,\ldots,e_n\langle w_1^n,\ldots,w_{k_n}^n\rangle\}\subset (u)_{fc}, \text{ and } \{e_1,\ldots,e_n\}\subset (u)_{fp}, \text{ and each } e_i \text{ becomes bound.}$

173

- 166 **c.** The variable c occurs somewhere in the environments  $\overline{[\Gamma]}$ .

  167 **6.** In a distributor  $u[e_1\langle w_1^1,\ldots,w_{k_1}^1\rangle\ldots e_n\langle w_1^n,\ldots,w_{k_n}^n\rangle|c\langle y_1,\ldots,y_m\rangle\overline{[\Gamma]}]$ 168 **a.** Both 5(a) and 5(b) hold.

  169 **b.** For all  $1 \le i \le m$ ,  $y_i$  occurs in the environments  $\overline{[\Gamma]}$ .
- We also work modulo permutation with respect to the variables in the cover of phantomabstractions. Let  $\vec{x}$  be a list of variables and let  $\vec{x_P}$  be a permutation of that list, then the following terms are considered equal.

$$u[\vec{x} \leftarrow t] \sim u[\vec{x_P} \leftarrow t]$$
  $c(\vec{x}).t \sim c(\vec{x_P}).t$ 

Terms are typed with the typing system for  $\Lambda^S$  extended with the distribution inference rule.

$$\frac{A \to (B_1 \land \dots \land B_n)}{(A \to B_1) \land \dots \land (A \to B_n)} d$$

This rule is the result of computationally interpreting the medial rule as done in [14]. We obtain this variant of the medial rule due to the restriction for implications and to avoid introducing disjunction to the typing system. The terms of  $\Lambda_a^S$  are then typed as in both Figure 3 and Figure 4. Note environments are typed by the derivations of all its closures composed horizontally with the conjunction connective.

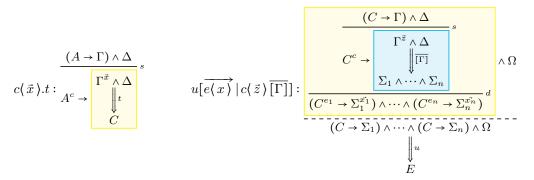

Figure 4 Typing derivations for phantom-abstractions and distributors

### 3.1 Compilation and Readback

We now define the translations between  $\Lambda_a^S$  and the original  $\lambda$ -calculus. First we define the interpretation  $\Lambda \to \Lambda_a^S$  (compilation). Intuitively, it replaces each abstraction  $\lambda x$ .— with the term  $x\langle x \rangle$ .— $[x_1, \ldots, x_n \leftarrow x]$  where  $x_1, \ldots, x_n$  replace the occurrences of x. Actual substitutions are denoted as  $\{t/x\}$ . Let  $|M|_x$  denote the number of occurrences of x in M, and if  $|M|_x = n$  let  $M\frac{n}{x}$  denote M with the occurrences of x by fresh, distinct variables  $x^1, \ldots, x^n$ . First, the translation of a closed term M is (M)', defined below

▶ **Definition 7** (Compilation). The interpretation for closed lambda terms,  $(\!(\Lambda)\!)': \Lambda \to \Lambda_a^S$  is defined below

188 
$$(x)' = x$$

$$(MN)' = (M)'(N)'$$

$$(\lambda x.M)' = \begin{cases} x\langle x \rangle.(M)' & \text{if } |M|_x = 1 \\ x\langle x \rangle.(M\frac{n}{x})'[x^1, \dots, x^n \leftarrow x] & \text{if } |M|_x = n \neq 1 \end{cases}$$

For an arbitrary term M, if  $x_1, \ldots, x_k$  are the free variables of M such that  $|M|_{x_i} = n_i > 1$ , the translation (M) is

$$(M \frac{n_1}{x_1} \dots \frac{n_k}{x_k})'[x_1^1, \dots, x_1^{n_1} \leftarrow x_1] \dots [x_k^1, \dots, x_k^{n_k} \leftarrow x_k]$$

The readback into the  $\lambda$ -calculus is slightly more complicated, specifically due to the bindings induced by the distributor. Interpreting a distributor  $[u[e_1\langle\vec{x_1}\rangle\dots e_n\langle\vec{x_n}\rangle|c\langle c\rangle]$  construct as a  $\lambda$ -term requires (1) converting the phantom-abstractions it binds in u into abstractions (2) collapsing the environment (3) maintaining the bindings between the converted abstractions and the intended variables located in the environment.

▶ **Definition 8.** Given a total function  $\sigma$  with domain D and codomain C, we overwrite the function with case  $x \mapsto V$  where  $x \in D$  and  $V \in C$  such that

$$\sigma[x \mapsto V](z) = \begin{cases} V & z = x \\ \sigma(z) & otherwise \end{cases}$$

194

196

197

201

203

204

214 215 When using the map  $\sigma$  as part of the translation, the intuition is that for all bound variables x in the term we are translatings, it should be that  $\sigma(x) = x$ . The map  $\gamma: V \to V$  is defined similarly, and the purpose is to keep track of the binding of phantom-variables.

**▶ Definition 9.** The interpretation  $[-]-]-[-]:\Lambda_a^S\times (V\to\Lambda)\times (V\to V)\to \Lambda$  is defined as

$$[x \mid \sigma \mid \gamma] = \sigma(x)$$

$$[st \mid \sigma \mid \gamma] = [s \mid \sigma \mid \gamma] [t \mid \sigma \mid \gamma]$$

$$[c\langle c \rangle.t \mid \sigma \mid \gamma] = \lambda c. [t \mid \sigma[c \mapsto c] \mid \gamma]$$

$$[c\langle x_1, \dots, x_n \rangle.t \mid \sigma \mid \gamma] = \lambda c. [t \mid \sigma[x_i \mapsto \sigma(x_i) \{c/\gamma(c)\}]_{i \in [n]} \mid \gamma]$$

$$[u[x_1, \dots, x_n \leftarrow t] \mid \sigma \mid \gamma] = [u \mid \sigma[x_i \mapsto [t \mid \sigma \mid \gamma]]_{i \in [n]} \mid \gamma]$$

$$[u[e_1 \langle \vec{w}_1 \rangle, \dots, e_n \langle \vec{w}_n \rangle \mid c \langle c \rangle [\overline{\Gamma}]] \mid \sigma \mid \gamma] = [u[\overline{\Gamma}] \mid \sigma \mid \gamma[e_i \mapsto c]_{i \in [n]}]$$

$$[u[e_1 \langle \vec{w}_1 \rangle, \dots, e_n \langle \vec{w}_n \rangle \mid c \langle x_1, \dots, x_m \rangle [\overline{\Gamma}]] \mid \sigma \mid \gamma] = [u[\overline{\Gamma}] \mid \sigma' \mid \gamma[e_i \mapsto c]_{i \in [n]}]$$

$$where \sigma' = \sigma[x_i \mapsto \sigma(x_i) \{c/\gamma(c)\}]_{i \in [n]}$$

216 The following Proposition justifies working modulo permutation equivalence.

- Proposition 10. For  $s, t \in \Lambda_a^S$ , if  $s \sim t$  then  $[\![ s ]\!] = [\![ t ]\!]$
- The following Lemma not only proves we have good translations, but is also important for proving confluence of  $\Lambda_a^S$  (Theorem 34).
  - ▶ **Lemma 11.** For a closed  $t \in \Lambda_a^S$ , in sharing normal form, and a closed  $N \in \Lambda$ .

### 3.2 Rewrite Rules

Both the spinal atomic  $\lambda$ -calculus and the atomic  $\lambda$ -calculus of [14] follow atomic reduction steps, i.e. they apply on individual constructors. The biggest difference is that our calculus

224

225

226

227

228

230

231

232

233

234

235

246

247

249

250

252

253

254

is capable of duplicating not only the skeleton but also the spine. The rewrite rules in our calculus make use of 3 operations, substitution, book-keeping, and exorcism.

The operation substitution  $t\{s/x\}$  propagates through the term t, and replaces the free occurences of the variable x with the term s. Moreover, if x occurs in the cover of a phantom-variable  $e(\vec{y} \cdot x)$ , then substitution replaces the x in the cover with  $(s)_{fv}$ ,  $e(\vec{y} \cdot (s)_{fv})$ .

Although substitution performs some book-keeping on phantom-abstractions, we define an explicit notion of book-keeping  $\{\vec{y}/e\}_b$  that updates the variables stored in a free cover i.e. for a term t,  $e(\vec{x}) \in (t)_{fc}$  then  $e(\vec{y}) \in (t\{\vec{y}/e\}_b)_{fc}$ .

The last operation we introduce is called *exorcism*  $\{c\langle\vec{x}\rangle\}_e$ . We perform exorcisms on phantom-abstractions to convert them to abstractions. Intuitively, this will be performed on phantom-abstractions with phantom-variables bound to a distributor when said distributor is eliminated. It converts phantom-abstractions to abstractions by introducing a sharing of the phantom-variable that captures the variables in the cover, i.e.  $c\langle\vec{x}\rangle_t \{c\langle\vec{x}\rangle\}_e = c\langle c\rangle_t t[\vec{x}\leftarrow c]$ .

Proposition 12. Given  $M \in \Lambda$  such that for all  $v \in V$ ,  $\gamma(v) \notin (M)_{fv}$  and  $\sigma(x) = x$ , the translation  $\llbracket u \mid \sigma \mid \gamma \rrbracket$  commutes with substitution  $\{M/x\}$  in the following way

$$[\![u\{t/x\}\,|\,\sigma\,|\,\gamma\,]\!] = [\![u\,|\,\sigma[x\mapsto[\![t\,|\,\sigma\,|\,\gamma\,]\!]]\,|\,\gamma\,]\!]$$

Proposition 13. Book-keeping commutes with the translation in the following way

if  $c(y_1, ..., y_m) \in (u)_{fc}$  such that  $\{x_1, ..., x_n\} \subset \{y_1, ..., y_m\}$ and for those  $z \in \{y_1, ..., y_m\}/\{x_1, ..., x_n\}$ ,  $\gamma(c) \notin (\sigma(z))_{fv}$ or if simply  $\{x_1, ..., x_n\} \cap (u)_{fv} = \{\}$ 

$$\llbracket u\{x_1,\ldots,x_n/c\}_b \mid \sigma \mid \gamma \rrbracket = \llbracket u \mid \sigma \mid \gamma \rrbracket$$

Proposition 14. Exorcisms commute with the translation in the following way if  $c(x_1, ..., x_n) \in (u)_{fc}$  or  $\{x_1, ..., x_n\} \cap (u)_{fv} = \{\}$ 

$$\llbracket u\{c\langle x_1,\ldots,x_n\rangle\}_e \mid \sigma \mid \gamma \rrbracket = \llbracket u \mid \sigma[x_i \mapsto c]_{i \in \lceil n \rceil} \mid \gamma \rrbracket$$

Using these operations, we define the rewrite rules that allow for spinal duplication. Firstly we have beta reduction  $(\leadsto_{\beta})$ , which requires an abstraction and not a phantom-abstraction.

$$(x\langle x\rangle.t)s \leadsto_{\beta} t\{s/x\} \tag{\beta}$$

However, its effect is very different: here  $\beta$ -reduction is a linear operation, since the bound variable x occurs exactly once in the body t. Any duplication of the term t in the atomic lambda-calculus proceeds via the sharing reductions, which we define next. The first set of sharing reduction rules move closures towards the outside of a term. Most of these rewrite rules only change the typing derivations in the way that subderivations are composed, with the exception of moving a closure out of scope of a distributor.

$$s[\Gamma] t \leadsto_L (st)[\Gamma] \tag{l_1}$$

$$st[\Gamma] \leadsto_L (st)[\Gamma]$$
 (l<sub>2</sub>)

$$d\langle \vec{x} \rangle.t[\Gamma] \leadsto_L (d\langle \vec{x} \rangle.t)[\Gamma] \text{ if } \{\vec{x}\} \cap (t)_{fv} = \{\vec{x}\}$$
 (l<sub>3</sub>)

$$u[x_1, \dots, x_n \leftarrow t[\Gamma]] \leadsto_L u[x_1, \dots, x_n \leftarrow t][\Gamma]$$
 (l<sub>4</sub>)

For the case of lifting a closure outside a distributor, we use a notation  $\| [\Gamma] \|$  to identify the variables captured by a closure, i.e.  $\| [\vec{x} \leftarrow t] \| = \{\vec{x}\}$  and  $\| [e_1 \langle \vec{x_1} \rangle, \dots, e_n \langle \vec{x_x} \rangle | c \langle c \rangle [\overline{\Gamma}]] \| = \{\vec{x}\}$ 

 $\{\vec{x_1},\ldots,\vec{x_n}\}$ . Then let  $\{\vec{z}\}=\parallel [\Gamma]\parallel$  in the following rewrite rule, that can only occur if  $\{\vec{x}\}\cap ([\Gamma])_{fv}=\{\}$ .

$$u[e_{1}\langle \vec{w}_{1}\rangle \dots e_{n}\langle \vec{w}_{n}\rangle | c\langle \vec{x}\rangle \overline{[\Gamma]}[\Gamma]]$$

$$\leadsto_{L} u\{(\vec{w}_{i}/\vec{z})/e_{i}\}_{b_{i}\in[n]}[e_{1}\langle \vec{w}_{1}/\vec{z}\rangle \dots e_{n}\langle \vec{w}_{n}/\vec{z}\rangle | c\langle \vec{x}\rangle \overline{[\Gamma]}][\Gamma]$$

$$(l_{5})$$

The proof rewrite rule corresponding with the rewrite rule  $l_5$  can be broken down into two parts. The first part is readjusting how the derivations compose as shown below.

The second part of the rewrite rule justifies the need for the book-keeping operation. In the rewrite below, let A be the type of a variable z where  $z \in \vec{z}$ . After lifting, we want to remove the variable from the cover as to ensure correctness since the variables in the cover denote the variables captured by the environment. Book-keeping allows us to remove these variables simultaneously.

$$C^{c} \rightarrow \begin{array}{c} (C \rightarrow \Gamma^{\vec{x}}) \wedge \Delta \wedge A \\ \hline C^{c} \rightarrow \begin{array}{c} \Gamma \wedge \Delta \\ \hline \Sigma_{1} \wedge \cdots \wedge \Sigma_{i} \wedge A \wedge \cdots \wedge \Sigma_{n} \\ \hline \end{array} \\ \hline \cdots \wedge (C^{e_{i}} \rightarrow \Sigma_{i}^{\vec{w}} \wedge A) \wedge \cdots \end{array} \qquad C^{c} \rightarrow \begin{array}{c} (C \rightarrow \Gamma^{\vec{x}}) \wedge \Delta \\ \hline \Gamma \wedge \Delta \\ \hline \Sigma_{1} \wedge \cdots \wedge \Sigma_{n} \\ \hline \end{array} \\ \hline \cdots \wedge (C \rightarrow \Sigma_{i}) \wedge \cdots \wedge C_{n} \\ \hline \end{array} \\ \hline \cdots \wedge (C^{e_{i}} \rightarrow \Sigma_{i}^{\vec{w}} \wedge A) \wedge \cdots \\ \hline \end{array}$$

The lifting rules  $(l_i)$  are justified by the need to lift closures out of the distributor, as opposed to duplicating them. The second set of rewrite rules, consecutive sharings are compounded and unary sharings are applied as substitutions.

$$u[w_1, \dots, w_m \leftarrow y_i][y_1, \dots, y_n \leftarrow t] \leadsto_C u[y_1, \dots, y_{i-1}, w_1, \dots, w_m, y_{i+1}, \dots, y_n \leftarrow t] \qquad (c_1)$$

$$u[x \leftarrow t] \leadsto_C u\{t/x\} \qquad (c_2)$$

The atomic steps for duplicating are given in the third and final set of rewrite rules. The first being the atomic duplication step of an application, which is the same rule used in [14]. The proof rewrite steps for each rule are also provided. For simplicity, in the equivalent proof rewrite step we only show the binary case for each rule.

$$u[x_{1} \dots x_{n} \leftarrow s t] \leadsto_{D} u\{z_{1} y_{1}/x_{1}\} \dots \{z_{n} y_{n}/x_{n}\} [z_{1} \dots z_{n} \leftarrow s] [y_{1} \dots y_{n} \leftarrow t]$$

$$\frac{(A \to B) \land A}{\frac{B}{B \land B}} @ \qquad \frac{(A \to B)}{(A \to B) \land (A \to B)} \land \land \frac{B}{B \land B} \land \qquad (A \to B) \land A}{\frac{(A \to B) \land A}{B} @ \land A} @$$

284

285

296

298

290

$$u[x_1, \dots, x_n \leftarrow c\langle \vec{y} \rangle.t] \leadsto_D$$

$$u\{e_i\langle w_1^i \rangle.w_1^i/x_i\}_{1 \le i \le n} [e_1\langle w_1^1 \rangle \dots e_n\langle w_1^n \rangle | c\langle \vec{y} \rangle [w_1^1, \dots, w_1^n \leftarrow t]]$$

$$(d_2)$$

$$\underbrace{(A \to B) \land \Gamma}_{A \to \bigcup_{C}} s \qquad \underbrace{(A \to B) \land \Gamma}_{A \to \bigcup_{C}} s \qquad \underbrace{A \to \bigcup_{C}}_{C \land C} \land C}_{A \to C) \land (A \to C)} \land \qquad \underbrace{(A \to B) \land \Gamma}_{A \to \bigcup_{C}} s \qquad \underbrace{A \to \bigcup_{C}}_{C \land C} \land C}_{C \land C} \land C$$

$$u[e_1\langle \vec{w}_1 \rangle \dots e_n\langle \vec{w}_n \rangle | c\langle c \rangle [\vec{w}_1, \dots, \vec{w}_n \leftarrow c]] \leadsto_D u\{e_1\langle \vec{w}_1 \rangle\}_e \dots \{e_n\langle \vec{w}_n \rangle\}_e$$
 (d<sub>3</sub>)

$$\frac{\overline{A \to \frac{A}{A \land A}}^{\lambda}}{(A \to A) \land (A \to A)}^{\lambda} \qquad \overline{A \to A}^{\lambda} \land \overline{A \to A}^{\lambda}$$

Each rewrite rule preserves the conclusion of the derivation, and thus the following proposition is easy to observe.

▶ Proposition 15. If  $s \leadsto_{L,C,D,\beta} t$  and s : C, then t : C

The readback translation collapses the shared terms. The lifting, duplication, and compound rules are used solely for the duplication of terms. Therefore it is expected that the following Lemma be true (proven in Appendix by induction). It is also important for proving confluence of  $\Lambda_a^S$  (Theorem 34).

**▶ Lemma 16** (Sharing reduction preserves denotation). If  $s \leadsto_{L,D,C} t$  then  $[s \mid \sigma \mid \gamma] = [t \mid \sigma \mid \gamma]$ 

# 4 Strong Normalisation of Sharing Reductions

In order to show our calculus is strongly normalising, we first show that the sharing reduction rules are strongly normalising. To do this, we make use of an 'intermediate calculus' called the weakening calculus. Following the approaches of [14], we indite a measure on terms based on its connection with the weakening calculus. We show that this measure strictly decreases as sharing reduction progresses. Additionally, similar ideas and results can be found elsewhere, i.e. with memory in [18], the  $\lambda$ -I calculus in [4], the  $\lambda$ -void calculus [2], and the weakening  $\lambda\mu$ -calculus [15].

**▶ Definition 17.** The w-terms and the weakening calculus  $(\Lambda_w)$  are

305 
$$T, U, V ::= x \mid \lambda x. T^* \mid UV \mid T[\leftarrow U] \mid \bullet$$
 (\*) where  $x \in (T)_{fv}$ 

The terms are variable, abstraction, application, weakening, and a bullet. In the weakening  $T[\leftarrow U]$ , the subterm U is weakened. The interpretation of atomic terms to weakening terms  $\|-\|_{-}\|_{\mathcal{W}}$  can be seen as an extension of the translation into the  $\lambda$ -calculus (Definition 9)

**Definition 18.** The interpretation  $[-|-|-]_{\mathcal{W}}: \Lambda_a^S \times (V \to \Lambda_{\mathcal{W}}) \times (V \to V) \to \Lambda_{\mathcal{W}}$  with maps  $\sigma: V \to \Lambda_{\mathcal{W}}$  and  $\gamma: V \to V$  is defined as an extension of the translation in (Definition

11 9) with the following additional special cases.

316

328

334

335

337

341

342

344

345

We also have translations of the weakening calculus to and from the lambda calculus. Both of these translations were provided in [14]. The interpretation [-] from weakening terms to  $\lambda$ -terms discards all weakenings. The interpretation  $(-]^{\mathcal{W}}: \Lambda \to \Lambda_{\mathcal{W}}$  is defined below.

**Definition 19.** The interpretation  $M \in \Lambda$ ,  $(-)^{w} : \Lambda \to \Lambda_{w}$  is defined by

322 
$$(x)^{\mathcal{W}} = x$$
323 
$$(MN)^{\mathcal{W}} = (M)^{\mathcal{W}} (N)^{\mathcal{W}}$$
324 
$$(\lambda x.N)^{\mathcal{W}} = \begin{cases} \lambda x.(N)^{\mathcal{W}} & \text{if } x \in (N)_{fv} \\ \lambda x.(N)^{\mathcal{W}} & \text{otherwise} \end{cases}$$

The following equalities can be observed, where  $\sigma^{\Lambda}(z) = [\sigma^{W}(z)]$ .

Proposition 20. For  $N \in \Lambda$  and  $t \in \Lambda_a^S$  the following properties hold

$$[\llbracket t \mid \sigma^{\mathcal{W}} \mid \gamma \rrbracket_{\mathcal{W}}] = \llbracket t \mid \sigma^{\Lambda} \mid \gamma \rrbracket \qquad \qquad \llbracket (N) \rrbracket^{\mathcal{W}} = (N)^{\mathcal{W}} \qquad \qquad [(N)^{\mathcal{W}} \mid = N)^{\mathcal{W}} = (N)^{\mathcal{W}} = (N)^{\mathcal$$

Definition 21. In the weakening calculus, β-reduction is defined as follows, where  $[\Gamma]$  are weakening constructs.

$$((\lambda x.T)\overline{[\Gamma]})U \to_{\beta} T\{U/x\}\overline{[\Gamma]}$$
  $(w_{\beta})$ 

Here we can take advantage that preservation of strong normalisation has been proven for this weakening calculus already in [14], providing the proof for Proposition 22.

▶ Proposition 22. If  $N \in \Lambda$  is strongly normalising, then so is  $(N)^{\mathcal{W}}$ 

When translating from the spinal atomic  $\lambda$ -calculus to the weakening calculus, weakenings are maintained whilst sharings are interpreted through duplication via substitution. Thus the reduction rules in the weakening calculus cover the spinal reductions for nullary distributors and weakenings.

**Definition 23.** The weakening reductions  $(\rightarrow_{\mathcal{W}})$  proceeds as follows.

$$\lambda x.T[\leftarrow U] \rightarrow_{\mathcal{W}} (\lambda x.T)[\leftarrow U] \quad \text{if } x \notin (U)_{fv}$$
  $(w_1)$ 

$$U[\leftarrow T]V \to_{\mathcal{W}} (UV)[\leftarrow T] \tag{w2}$$

$$UV[\leftarrow T] \rightarrow_{\mathcal{W}} (UV)[\leftarrow T]$$
 (w<sub>3</sub>)

$$T[\leftarrow U[\leftarrow V]] \to_{\mathcal{W}} T[\leftarrow U][\leftarrow V] \tag{w_4}$$

$$T[\leftarrow \lambda x.U] \rightarrow_{\mathcal{W}} T[\leftarrow U\{\bullet/x\}]$$
 (w<sub>5</sub>)

$$T[\leftarrow UV] \to_{\mathcal{W}} T[\leftarrow U][\leftarrow V] \tag{w_6}$$

$$T[\leftarrow \bullet] \to_{\mathcal{W}} T \tag{w7}$$

$$T[\leftarrow U] \to_{\mathcal{W}} T \quad \text{if } U \text{ is a subterm of } T \tag{w_8}$$

It is easy to see that these rules correspond to special cases of the sharing reduction rules for  $\Lambda_a^S$ . Lifting a closure relates  $(w_1)$  and  $(l_3)$ ,  $(w_2)$  and  $(l_1)$ ,  $(w_3)$  and  $(l_2)$ ,  $(w_4)$  and  $(l_4)$ ,  $(w_5)$  and  $(d_2)$ , and duplicating a term relates  $(w_6)$  and  $(d_1)$ , and  $(w_7)$  and  $(d_3)$ . It is not 351 so obvious to see what the case  $(w_8)$  corresponds to. If U is a subterm of T, then in the corresponding  $\Lambda_a^S$ -term this term would be shared and one of the copies would be in a 353 weakening. Thus this reduction relates to the case  $(c_1)$ , where we remove the weakening. 354 We demonstrate by considering  $t \in y[\vec{x} \cdot y \cdot \vec{z} \leftarrow u] \leadsto_C t[\vec{x} \cdot \vec{z} \leftarrow u]$ . On the left hand side, 355 the corresponding weakening-term (obtained by  $(-)^{w}$ ) would have the weakening  $[\leftarrow U]$ 356 where  $U = (u)^{w}$ . This is because U is substituted into  $[\leftarrow y]$ , but on the right hand side this would be gone. This situation can only occur if there are other copies of U substituted into the term. This corresponds to if only the corresponding  $(c_1)$  reduction rule can occur. This resemblace is confirmed by the following Lemmas.

▶ **Lemma 24.** If  $t \leadsto_{\beta} u$  then  $\llbracket t \rrbracket^{\mathcal{W}} \to_{\beta}^{+} \llbracket u \rrbracket^{\mathcal{W}}$ 

362

363

365

378

379

380

381

382

384

▶ Lemma 25. If  $t \leadsto_{(C,D,L)} u$  and for any  $x \in (t)_{bv} \cup (t)_{fp}$  and for all  $z, x \notin (\sigma(z))_{fv}$ .

$$[\![t\,|\,\sigma\,|\,\gamma]\!]_{\mathcal{W}} \to_{\mathcal{W}}^* [\![u\,|\,\sigma\,|\,\gamma]\!]_{\mathcal{W}}$$

We now define the components that we use for our measure on spinal atomic  $\lambda$ -terms that we will use to prove strong normalisation of sharing reductions. The *height* of a term is intuitively a multiset of integers that record the distance of each sharing. The distance is measured by the number of constructors from the sharing node to the root of the term in its graphical notation. The height is defined on terms as  $\mathcal{H}^i(-)$ , where i is an integer. We say  $\mathcal{H}(t)$  for  $\mathcal{H}^1(t)$ . We use  $\cup$  to denote the disjoint union of two multisets. We denote  $\mathcal{H}^i([\Gamma_1]) \cup \cdots \cup \mathcal{H}^i([\Gamma_n])$  as  $\mathcal{H}^i([\overline{\Gamma}])$  for the environment  $[\overline{\Gamma}] = [\Gamma_1], \ldots, [\Gamma_n]$ .

**Definition 26** (Sharing Height). The sharing height  $\mathcal{H}^i(t)$  of a term t is given by

```
\mathcal{H}^{i}(x) = \{\}
\mathcal{H}^{i}(st) = \mathcal{H}^{i+1}(s) \cup \mathcal{H}^{i+1}(t)
\mathcal{H}^{i}(c(\vec{x}) \cdot t) = \mathcal{H}^{i+1}(t)
\mathcal{H}^{i}(t[\Gamma]) = \mathcal{H}^{i}(t) \cup \mathcal{H}^{i}([\Gamma]) \cup \{i^{1}\}
\mathcal{H}^{i}([x_{1}, \dots, x_{n} \leftarrow t]) = \mathcal{H}^{i+1}(t)
\mathcal{H}^{i}([e\langle \vec{w} \rangle | c\langle \vec{x} \rangle [\Gamma]]) = \mathcal{H}^{i+1}([\Gamma]) \cup \{(i+1)^{n}\} \text{ where } n \text{ is the number of closures in } [\Gamma]
```

This measure then strictly decreases for the rewrite rules  $l_1$ ,  $l_2$ ,  $l_3$ ,  $l_4$  and  $l_5$ .

▶ Lemma 27. If  $t \leadsto_{(L)} u$  then  $\mathcal{H}^i(t) > \mathcal{H}^i(u)$ 

The other measure we consider is the weight of a term. Intuitively this quantifies the remaining duplications, which are performed with  $\leadsto_D$  reductions. Calculating the weight of a term requires an auxiliary function from variables to integers. This function is defined by assigning integer weights to the variables of a term. This auxiliary function is defined on terms  $\mathcal{V}^i(-)$ , where i is an integer. To measure variables independently of binders is vital. It allows to measure distributors, which duplicate  $\lambda$ 's but not the bound variable. Also, only bound variables for abstractions are measured since variables bound by sharings are substituted in the interpretation.

Definition 28 (Variable Weights). The function  $V^i(t)$  returns a function that assigns integer weights to the free variables of t. It is defined by the following

$$\mathcal{V}^{i}(x) = \{x \mapsto i\}$$

$$\mathcal{V}^{i}(st) = \mathcal{V}^{i}(s) \cup \mathcal{V}^{i}(t)$$

$$\mathcal{V}^{i}(c\langle c \rangle.t) = \mathcal{V}^{i}(t)/\{c\}$$

$$\mathcal{V}^{i}(c\langle \vec{x} \rangle.t) = \mathcal{V}^{i}(t) \cup \{c \mapsto i\}$$

$$\mathcal{V}^{i}(t[\leftarrow s]) = \mathcal{V}^{i}(t) \cup \mathcal{V}^{1}(s)$$

$$\mathcal{V}^{i}(t[x_{1}, \dots, x_{n} \leftarrow s]) = \mathcal{V}^{i}(t)/\{x_{1}, \dots, x_{n}\} \cup \mathcal{V}^{f(x_{1}) + \dots + f(x_{n})}(s) \text{ where } f = \mathcal{V}^{i}(t)$$

$$\mathcal{V}^{i}(t[e_{1}\langle \vec{w}_{1} \rangle \dots e_{n}\langle \vec{w}_{n} \rangle | c\langle c \rangle [\overline{\Gamma}]]) = \mathcal{V}^{i}(t[\overline{\Gamma}])/\{c, e_{1}, \dots, e_{n}\} \cup \{c \mapsto i\}$$

$$\mathcal{V}^{i}(t[e_{1}\langle \vec{w}_{1} \rangle \dots e_{n}\langle \vec{w}_{n} \rangle | c\langle \vec{x} \rangle [\overline{\Gamma}]]) = \mathcal{V}^{i}(t[\overline{\Gamma}])/\{e_{1}, \dots, e_{n}\} \cup \{c \mapsto i\}$$

The weight of a term can then be defined via the use of this auxiliary function. The auxiliary function is used when calculating the weight of a sharing, where the sharing weight of the variables bound by the sharing play a significant role in calculating the weight of the shared term. In the case of a weakening, we assign an initial weight of 1 to indicate that the constructor is not duplicated by appears at least once in the weakening calculus. Again we say  $W(t) = W^1(t)$ .

▶ **Definition 29** (Sharing Weight). The sharing weight  $W^i(t)$  of a term t is a multiset of integers computed by the function defined below

$$\mathcal{W}^{i}(x) = \{\}$$

$$\mathcal{W}^{i}(st) = \mathcal{W}^{i}(s) \cup \mathcal{W}^{i}(t) \cup \{i\}$$

$$\mathcal{W}^{i}(c\langle c\rangle.t) = \mathcal{W}^{i}(t) \cup \{i\} \cup \{\mathcal{V}^{i}(t)(c)\}$$

$$\mathcal{W}^{i}(c\langle \vec{x}\rangle.t) = \mathcal{W}^{i}(t) \cup \{i\}$$

$$\mathcal{W}^{i}(t[\leftarrow s]) = \mathcal{W}^{i}(t) \cup \mathcal{W}^{1}(s)$$

$$\mathcal{W}^{i}(t[x_{1}, \dots, x_{n} \leftarrow s]) = \mathcal{W}^{i}(t) \cup \mathcal{W}^{f(x_{1}) + \dots + f(x_{n})}(s) \text{ where } f = \mathcal{V}^{i}(t)$$

$$\mathcal{W}^{i}(t[e_{1}\langle \vec{w_{1}}\rangle...e_{n}\langle \vec{w_{n}}\rangle|c\langle c\rangle[\overline{\Gamma}]]) = \mathcal{W}^{i}(t[\overline{\Gamma}]) \cup \{\mathcal{V}^{i}(t[\overline{\Gamma}])(c)\}$$

$$\mathcal{W}^{i}(t[e_{1}\langle \vec{w_{1}}\rangle...e_{n}\langle \vec{w_{n}}\rangle|c\langle \vec{x}\rangle[\overline{\Gamma}]]) = \mathcal{W}^{i}(t[\overline{\Gamma}])$$

We show that this measure then strictly decreases on the rewrite rules  $d_1$ ,  $d_2$ ,  $d_3$  and is unaffected by all the other sharing reduction rules.

```
Lemma 30. If t \leadsto_D u then W^i(t) > W^i(u)
```

419

420

422

424

Lemma 31. If 
$$t \leadsto_{(I,C)} u$$
 then  $\mathcal{W}^i(t) = \mathcal{W}^i(u)$ 

The last measure we consider is the number of closures in the term, where is can be easily observed that the rewrite rules  $c_1$  and  $c_2$  strictly decrease this measure, and that the  $\leadsto_L$  rules do not alter the number of closures. We then use this along with height and weight to define a *sharing measure* on terms.

- ▶ **Definition 32.** The sharing measure of a  $\Lambda_a^S$ -term t is a triple  $(W(t), C, \mathcal{H}(t))$  where C is the number of closures in t. We can compare two different sharing measures by considering the lexicographical preferences according to weight > number of closures > height.
- ▶ **Theorem 33.** Sharing reduction  $\leadsto_{(D,L,C)}$  is strongly normalising

### 23:14 Spinal Atomic Lambda-Calculus

433

438

439

443

**Proof.** From Lemma 30, Lemma 31, and Lemma 27, it follows that the sharing measure of a term is strictly decreasing under  $\leadsto_{(D,L,C)}$ , proving the statement.

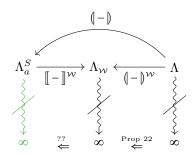

Now that we have proven the sharing reductions are strongly normalising, we can prove that they are confluent for closed terms.

▶ **Theorem 34.** The sharing reduction relation  $\leadsto_{(D,L,C)}$  is confluent

**Proof.** Lemma 16 tells us that the preservation is preserved under reduction i.e. for  $s \leadsto_{(D,L,C)} t$ ,  $\llbracket s \rrbracket = \llbracket t \rrbracket$ . Therefore given  $t \leadsto_{(D,L,C)}^* s_1$  and  $t \leadsto_{(D,L,C)}^* s_2$ ,  $\llbracket t \rrbracket = \llbracket s_1 \rrbracket = \llbracket s_2 \rrbracket$ . Since we know that sharing reductions are strongly normalising, we know there exists terms  $u_1$  and  $u_2$  in sharing normal form such that  $s_1 \leadsto_{(D,L,C)}^* u_1$  and  $s_2 \leadsto_{(D,L,C)}^* u_2$ . Lemma 11 tells us that terms in closed terms in sharing normal form are in correspondence with their denotations i.e.  $(\llbracket t \rrbracket)' = t$ . Since by Lemma 16 we know  $\llbracket u_1 \rrbracket = \llbracket s_1 \rrbracket = \llbracket s_2 \rrbracket = \llbracket u_2 \rrbracket$ , and by Lemma 11  $(\llbracket u_1 \rrbracket)' = u_1$  and  $(\llbracket u_2 \rrbracket)' = u_2$ , we can conclude  $u_1 = u_2$ . Hence, we prove confluence.

## 5 Preservation of Strong Normalisation

Here we show how  $\Lambda_a^S$  preserves strong normalisation with respect to the  $\lambda$ -calculus. Recall that by Proposition 20 that for all  $N \in \Lambda$ ,  $\llbracket ( \lVert N ) \rrbracket^{\mathcal{W}} = ( \lVert N )^{\mathcal{W}}$ , and that Proposition 22 states if a term  $N \in \Lambda$  is strongly normalising then so is  $( \lVert N ) \rrbracket^{\mathcal{W}}$ . Observe that the statement 'if term M has an infinite reduction sequence then term N has an infinite reduction sequence' is equivalent to 'if term N is strongly normalising then term M is strongly normalising' by contraposition. Therefore, given a strongly normalising term  $N \in \Lambda$ , we know that its corresponding weakening term is also strongly normalising. Furthermore, since  $\llbracket ( \lVert N ) \rrbracket^{\mathcal{W}} = ( \lVert N ) \rrbracket^{\mathcal{W}}$ , we know that  $\llbracket ( \lVert N ) \rrbracket^{\mathcal{W}}$  is also strongly normalising.

We prove that the spinal atomic  $\lambda$ -calculus preserves strong normalisation with the following.

**Lemma 35.** For  $t ∈ Λ_a^S$  has an infinite reduction path, then  $[t]^W$  also has an infinite reduction path.

Proof. Due to Theorem 34, we know that the infinite reduction path contains an infinite  $\beta$ -reduction. This means in the reduction sequence, between each  $\beta$ -reduction, there are finite many  $\leadsto_{(D,L,C)}$  reduction steps. Lemma 25 says each  $\leadsto_{(D,L,C)}$  step in  $\Lambda_a^S$  corresponds to zero or more weakening reductions ( $\leadsto_w^*$ ). Lemma 24 says that each beta reduction in  $\Lambda_a^S$  corresponds to one or more  $\beta$ -steps in  $\Lambda_w$ . Therefore, it is inevitable that  $[t]^w$  also has an infinite reduction path.

▶ **Theorem 36.** If  $N \in \Lambda$  is strongly normalising, then so is (N).

460 **Proof.** For a given N ∈ Λ that is strongly normalising, we know by Lemma 22 that  $(N)^{W}$  is strongly normalising. Then  $[(N)]^{W}$  is strongly normalising, since Proposition 20 states that  $(N)^{W} = [(N)]^{W}$ . Then by Lemma 35, which states that if  $[t]^{W}$  is strongly normalising, then t is strongly normalising, proves that (N) is strongly normalising.

# **A** The Spinal Atomic $\lambda$ -Calculus

### A.1 Compilation and Readback

In this section we provide the proof for Proposition 11: For  $s, t \in \Lambda_a^S$ , if  $s \sim t$  then  $[\![s]\!] = [\![t]\!]$ .

Proof. Let us consider the cases.

Inductive Case: Abstraction

581

545

546  $t[\Gamma_{1}][\Gamma_{2}] \sim t[\Gamma_{2}][\Gamma_{1}]$ 547
Consider  $\llbracket t[\Gamma_{1}][\Gamma_{2}] \mid \sigma \mid \gamma \rrbracket = \llbracket t[\Gamma_{1}] \mid \sigma' \mid \gamma' \rrbracket = \llbracket t \mid \sigma'' \mid \gamma'' \rrbracket$ . Since due to conditions any variable  $x \in \llbracket \Gamma_{2} \rrbracket \parallel$  cannot occur in  $[\Gamma_{1}]$ , for all subterms s located in  $[\Gamma_{1}]$ ,  $\llbracket s \mid \sigma' \mid \gamma' \rrbracket = \llbracket s \mid \sigma \mid \gamma \rrbracket$ .

548
Therefore  $\llbracket t \mid \sigma'' \mid \gamma'' \rrbracket = \llbracket t[\Gamma_{2}] \mid \sigma''' \mid \gamma''' \rrbracket = \llbracket t[\Gamma_{2}] \mid \Gamma_{1}] \mid \sigma \mid \gamma \rrbracket$ .

The remaining cases discuss permutations of variables in sharings and phantom-abstractions. In both these cases, we overwrite  $\sigma$  for the cases of the variables in said sharing or phantom-abstractions. The order in which they appear do not influence the translation since we do this for all variables regardless.

We also provide the proof for Lemma 11: For a closed  $t \in \Lambda_a^S$ , where t has no distributor constructs and only variables are shared, and a closed  $N \in \Lambda$ . the following

$$[\![(N)']\!] = N \qquad \qquad ([\![t]\!])' = t \qquad \qquad \exists_{M \in \Lambda} . t = (M)'$$

```
Proof. We prove [(N)'] = N by induction on N
555
556
        Base Case: Variable
557
        [ (x)'] = [x] = x
558
550
        Inductive Case: Application
560
        \llbracket (M N)' \rrbracket = \llbracket (M)' \rrbracket \llbracket (N)' \rrbracket = M N
562
        Inductive Case: Abstraction
563
        [(\lambda x.M)']
564
               Case: |M|_x = 1
565
               = \lambda x. \llbracket (M)' \rrbracket = \lambda x. M
567
               Case: |M|_x = n
              =\lambda x. \llbracket \left(\!\!\lceil M\frac{n}{x} \right)\!\!\rceil [x_1,\ldots,x_n \leftarrow x] \rrbracket = \lambda x. \llbracket \left(\!\!\lceil M\frac{n}{x} \right)\!\!\rceil |\sigma| I \rrbracket = \lambda x. \llbracket \left(\!\!\lceil M\frac{n}{x} \right)\!\!\rceil [x/x_i]_{1 \leq i \leq n}
569
              \stackrel{\text{I.H.}}{=} \lambda x. M \frac{n}{x} \{x/x_i\}_{1 \le i \le n} = \lambda x. M
571
572
        We prove (\llbracket t \rrbracket)' = t by induction on t
573
574
        Base Case: Variable
575
        ( [x])' = (x)' = x
576
577
        Inductive Case: Application
578
        (\llbracket st \rrbracket)' = (\llbracket s \rrbracket)' (\llbracket t \rrbracket)' \stackrel{\text{I.H.}}{=} st
579
```

```
Case: ([x\langle x \rangle.t])' = x\langle x \rangle.([t])' \stackrel{\text{i.H.}}{=} x\langle x \rangle.t

Case: ([x\langle x \rangle.t[x_1, \dots, x_n \leftarrow x]])' = (\lambda x.[t|\sigma|I])'

= (\lambda x.[t]\{x/x_i\}_{1 \le i \le n})' = x\langle x \rangle.([t])'[x_1, \dots, x_n \leftarrow x]

\stackrel{\text{i.H.}}{=} x\langle x \rangle.t[x_1, \dots, x_n \leftarrow x]
```

The proof for  $\exists_{M \in \Lambda} . t = (M)'$  is the same as in [14].

#### A.2 Rewrite Rules

In this section we provide the proof for Proposition 40: Given  $M \in \Lambda$  such that for all  $v \in V$ ,  $\gamma(v) \notin (M)_{fv} \text{ and } \sigma(x) = x, \text{ the translation } \llbracket u \mid \sigma \mid \gamma \rrbracket \text{ commutes with substitution } \{M/x\} \text{ in}$ the following way

$$\llbracket u\{t/x\} \, | \, \sigma \, | \, \gamma \, \rrbracket = \llbracket \, u \, | \, \sigma[x \mapsto \llbracket \, t \, | \, \sigma \, | \, \gamma \, \rrbracket] \, | \, \gamma \, \rrbracket$$

```
Proof. We prove this by induction on u
594
                       Base Case: Variable
                       [\![x\{t/x\} \mid \sigma \mid \gamma]\!] = [\![t \mid \sigma \mid \gamma]\!] = [\![x \mid \sigma' \mid \gamma]\!]
597
                       \llbracket y \mid \sigma \mid \gamma \rrbracket = \sigma(y) = \sigma'(y) = \llbracket y \mid \sigma' \mid \gamma \rrbracket
599

The weakening calculus is used to show preservation of strong normalisation with respect to the  $\lambda$ -calculus. A  $\beta$ -step in our calculus may occur within a weakening, and therefore is simulated by zero  $\beta$ -steps in the  $\lambda$ -calculus. Therefore if there is an infinite reduction path located inside a weakening in  $\Lambda_a^S$ , then the reduction path is not preserved in the corresponding  $\lambda$ -term as there are no weakenings. To deal with this, just as done in [2, 14, 15], we make use of the weakening calculus. A  $\beta$ -step is non-deleteing precisely because of the weakening construct. If a  $\beta$ -step would be deleting in the  $\lambda$ -calculus, then the weakening calculus would instead keep the deleted term around as 'garbage', which can continue to reduce unless explicitly 'garbage-collected' by extra (non- $\beta$ ) reduction steps. The weakening calculus has already been shown to preserve strong normalisation through the use of a perpetual strategy in [14]. A part of proving PSN is then using the weakening calculus to prove that if  $t \in \Lambda_a^S$  has a infinite reduction path, then its translation into the weakening calculus also has an infinite reduction path.

Here we will give more concrete definitions of substitution, book-keeping and exorcisms respectively.

▶ **Definition 37** (Substitution). The operation substitution is defined as

```
x\{s/x\} = s

           Where \vec{z} = (s)_{fv}
```

Although substitution performs some book-keeping on phantom-abstractions, we define an explicit notion that updates the variables stored in a free-cover i.e. for a term t,  $e\langle \vec{x} \rangle \in (t)_{fc}$  then  $e\langle \vec{y} \rangle \in (t\{\vec{y}/e\}_b)_{fc}$ .

▶ **Definition 38** (Book-Keeping). *The operation* book-keeping *is defined as* 

```
s \{\vec{w}/e\}_b = x
s \{\vec{w}/e\}_b = (s\{\vec{w}/e\}_b) t\{\vec{w}/e\}_b
e(\vec{z}).t\{\vec{w}/e\}_b = e(\vec{w}).t
s \{\vec{w}/e\}_b = c(\vec{z}).t\{\vec{w}/e\}_b
s \{\vec{w}/e\}_b = c(\vec{z}).t\{\vec{w}/e\}_b
s \{\vec{w}/e\}_b = u\{\vec{w}/e\}_b [\vec{z} \leftarrow t\{\vec{w}/e\}_b]
s \{\vec{w}/e\}_b = u\{\vec{w}/e\}_b [\vec{z} \leftarrow t\{\vec{w}/e\}_b]
s \{\vec{w}/e\}_b = u\{\vec{w}/e\}_b [\vec{z} \leftarrow t\{\vec{w}/e\}_b]
s \{\vec{w}/e\}_b = u\{\vec{y}/e\}_b [\vec{z} \leftarrow t\{\vec{w}/e\}_b]
s \{\vec{w}/e\}_b = u\{\vec{y}/e\}_b [\vec{z} \leftarrow t\{\vec{w}/e\}_b]
s \{\vec{w}/e\}_b = u\{\vec{y}/e\}_b [\vec{z} \leftarrow t\{\vec{w}/e\}_b]
```

$$u[\overrightarrow{f\langle\vec{y}\rangle}|c\langle\vec{z}\rangle\{\vec{w}/e\}_b[\overline{\Gamma}]] = u\{\vec{w}/e\}_b[\overrightarrow{f\langle\vec{y}\rangle}|c\langle\vec{z}\rangle[\overline{\Gamma}]]$$
\*\*Definition 39 (Exorcism). The operation exorcism is defined as

$$y\{c\langle\vec{x}\,\rangle\}_{e} = y$$

$$st\{c\langle\vec{x}\,\rangle\}_{e} = (s\{c\langle\vec{x}\,\rangle\}_{e})t\{c\langle\vec{x}\,\rangle\}_{e}$$

$$st\{c\langle\vec{x}\,\rangle\}_{e} = (s\{c\langle\vec{x}\,\rangle\}_{e})t\{c\langle\vec{x}\,\rangle\}_{e}$$

$$st\{c\langle\vec{x}\,\rangle\}_{e} = (s\{c\langle\vec{x}\,\rangle\}_{e})t\{c\langle\vec{x}\,\rangle\}_{e}$$

$$st\{c\langle\vec{x}\,\rangle\}_{e} = c\langle c\rangle.t[\vec{x}\leftarrow c]$$

$$d\langle\vec{y}\,\rangle.t\{c\langle\vec{x}\,\rangle\}_{e} = d\langle\vec{y}\,\rangle.t\{c\langle\vec{x}\,\rangle\}_{e}$$

$$u[\vec{y}\leftarrow t]\{c\langle\vec{x}\,\rangle\}_{e} = u\{c\langle\vec{x}\,\rangle\}_{e}[\vec{y}\leftarrow t\{c\langle\vec{x}\,\rangle\}_{e}]$$

$$stantial \qquad u[e\langle\vec{w}\,\rangle](c\langle\vec{x}\,\rangle[\Gamma]]\{c\langle\vec{x}\,\rangle\}_{e} = u[e\langle\vec{w}\,\rangle](c\langle c\rangle[\Gamma][\vec{x}\leftarrow c]]$$

$$stantial \qquad u[e\langle\vec{w}\,\rangle](d\langle\vec{y}\,\rangle[\Gamma]]\{c\langle\vec{x}\,\rangle\}_{e} = u[e\langle\vec{w}\,\rangle](d\langle\vec{y}\,\rangle[\Gamma]\{c\langle\vec{x}\,\rangle\}_{e}]$$

$$u[e\langle\vec{w}\,\rangle](d\langle\vec{y}\,\rangle\{c\langle\vec{x}\,\rangle\}_{e}[\Gamma]] = u\{c\langle\vec{w}\,\rangle\}_{e}[e\langle\vec{w}\,\rangle](d\langle\vec{y}\,\rangle[\Gamma]]$$

We demonstrate that our readback translation (Definition 18) is truly an extention of the translation into the  $\lambda$ -calculus (Definition 9). We therefore demonstrate that our operations (substitution, book-keeping, and exorcisms) commute with the two translation functions in the same way.

Proposition 40. Given  $M \in \Lambda$  such that for all  $v \in V$ ,  $\gamma(v) \notin (M)_{fv}$  and  $\sigma(x) = x$ , the translation  $[\![u\,|\,\sigma\,|\,\gamma]\!]_{\mathcal{W}}$  commutes with substitution  $\{M/x\}$  in the following way

$$\llbracket u\{t/x\} \mid \sigma \mid \gamma \rrbracket_{\mathcal{W}} = \llbracket u \mid \sigma \lceil x \mapsto \llbracket t \mid \sigma \mid \gamma \rrbracket_{\mathcal{W}} \rceil \mid \gamma \rrbracket_{\mathcal{W}}$$

Proof. We prove this by induction on u. The argument is similar to the proof of Proposition 40. We only discuss here to cases involving the three special cases defined in Definition 18.

            (N)^{\mathcal{W}} holds
1059
            [\![ (N)]\!]^{\mathcal{W}} = [\![ (N\frac{n_1}{x_1} \ldots \frac{n_k}{x_k})'[x_1^1, \ldots, x_1^{n_1} \leftarrow x_1] \ldots [x_k^1, \ldots, x_k^{n_k} \leftarrow x_k] ]\!]^{\mathcal{W}}
1061
            \stackrel{\text{prop 43}}{=} \mathbb{I}\left[\left(N\frac{n_1}{x_1}\dots\frac{n_k}{x_k}\right)'\right]^{\mathcal{W}} \{x_i/x_i^j\}_{1\leq i\leq k, 1\leq j\leq n_i} = \left(N\frac{n_1}{x_1}\dots\frac{n_k}{x_k}\right)^{\mathcal{W}} \{x_i/x_i^j\}_{1\leq i\leq k, 1\leq j\leq n_i} = \left(N\right)^{\mathcal{W}}
                      We also discuss the proofs for Lemma 24 and Lemma 25. These are: Given t \leadsto_{\beta} u then
                                                                                                                  [t]^{\mathcal{W}} \rightarrow_{\beta}^{+} [u]^{\mathcal{W}}
            and given t \leadsto_{(C,D,L)} u and for any x \in (t)_{bv} \cup (t)_{fp} and for all z, x \notin (\sigma(z))_{fv}.
                                                                                                   [t \mid \sigma \mid \gamma]_{\mathcal{W}} \rightarrow_{\mathcal{W}}^* [u \mid \sigma \mid \gamma]_{\mathcal{W}}
            Proof. We prove this by induction. We first discuss all the case bases. [(x\langle x\rangle.t)s]^{w} =
```

We prove this is true case-by-case, which is an extension of the proof for Lemma 16. Therefore,

 $(\lambda x.T) S = T\{S/x\} = [t\{s/x\}]^{\mathcal{W}}$ where  $T = [t]^{\mathcal{W}}$  and  $S = [s]^{\mathcal{W}}$ . we only show the interesting cases.

Case: 
$$(d_1)$$

$$u[\leftarrow st] \leadsto_R u[\leftarrow s][\leftarrow t]$$

$$\begin{split} & \llbracket u [\leftarrow s \, t] \, |\sigma| \gamma \, \rrbracket_{\mathcal{W}} = \llbracket u \, |\sigma| \gamma \, \rrbracket_{\mathcal{W}} [\leftarrow \llbracket s \, |\sigma| \gamma \, \rrbracket_{\mathcal{W}} \llbracket t \, |\sigma| \gamma \, \rrbracket_{\mathcal{W}}] \\ & \to_{\mathcal{W}} \llbracket u \, |\sigma| \gamma \, \rrbracket_{\mathcal{W}} [\leftarrow \llbracket s \, |\sigma| \gamma \, \rrbracket_{\mathcal{W}}] [\leftarrow \llbracket t \, |\sigma| \gamma \, \rrbracket_{\mathcal{W}}] = \llbracket u [\leftarrow s] [\leftarrow t] \, |\sigma| \gamma \, \rrbracket_{\mathcal{W}}$$

Case:  $(d_2)$ 

$$u[\leftarrow c\langle \vec{x} \rangle.t] \leadsto_R u[|c\langle \vec{x} \rangle[\leftarrow t]]$$

$$[\![u[\leftarrow c\langle\,\vec{x}\,\rangle.t]\,|\,\sigma\,|\,\gamma\,]\!]_{\mathcal{W}}$$

SubCase:  $\vec{x} = c$ 

SubCase:  $\vec{x} = x_1, \dots, x_n$ 

Case:  $(d_3)$ 

$$u[|c\langle c\rangle[\leftarrow c]] \leadsto_R u$$

$$\begin{split} & \llbracket u [ \, | \, c \langle \, c \, \rangle \, [\leftarrow c] \, ] \, | \, \sigma \, | \, \gamma \, \rrbracket_{\mathcal{W}} = \llbracket \, u [\leftarrow c] \, | \, \sigma' \, | \, \gamma \, \rrbracket_{\mathcal{W}} = \llbracket \, u \, | \, \sigma' \, | \, \gamma \, \rrbracket_{\mathcal{W}} [\leftarrow \bullet] \\ & = \llbracket \, u \, | \, \sigma \, | \, \gamma \, \rrbracket_{\mathcal{W}} [\leftarrow \bullet] \rightarrow_{\mathcal{W}} \llbracket \, u \, | \, \sigma \, | \, \gamma \, \rrbracket_{\mathcal{W}} \end{aligned}$$

Case  $(c_2)$ 

$$u[x \leftarrow t] \leadsto_C u\{t/x\}$$

$$[\![u[x\leftarrow t]|\,\sigma\,|\,\gamma]\!]_{\mathcal{W}} = [\![u\,|\,\sigma'\,|\,\gamma]\!]_{\mathcal{W}} = [\![u\{t/x\}|\,\sigma\,|\,\gamma]\!]_{\mathcal{W}}$$
 where

 $\sigma' = \sigma[x \mapsto [t \mid \sigma \mid \gamma]_{w}]$ 

For the remaining cases, we only show the cases for  $[\![u[\leftarrow t]]\sigma|\gamma]\!]_{\mathcal{W}} = [\![u|\sigma|\gamma]\!]_{\mathcal{W}}[\leftarrow [\![t|\sigma|\gamma]\!]_{\mathcal{W}}]$ . The other cases are similar to those in the proof for Lemma 16.

Case:  $(l_1)$ 

$$s[\leftarrow t]u \leadsto_L (su)[\leftarrow t]$$

$$[\![s[\leftarrow t]u|\sigma|\gamma]\!]_{\mathcal{W}} = [\![s|\sigma|\gamma]\!]_{\mathcal{W}} [\![\leftarrow [\![t|\sigma|\gamma]\!]_{\mathcal{W}}] [\![u|\sigma|\gamma]\!]_{\mathcal{W}} \rightarrow_{\mathcal{W}} ([\![s|\sigma|\gamma]\!]_{\mathcal{W}} [\![u|\sigma|\gamma]\!]_{\mathcal{W}}) [\![\leftarrow [\![t|\sigma|\gamma]\!]_{\mathcal{W}}] [\![(su)[\leftarrow t]|\sigma|\gamma]\!]_{\mathcal{W}}$$

The proofs for lifting past application (right)  $(l_2)$  and sharing  $(l_4)$  follow a similar argument so we choose to omit these cases

Case: 
$$(l_3)$$

$$d\langle \vec{x} \rangle.u[\leftarrow t] \leadsto_L (d\langle \vec{x} \rangle.u)[\leftarrow t] \text{ iff } \vec{x} \notin (t)_{fv}$$

```

We prove strong normalisation of sharing reductions through the use of *multisets*. Intuitively, a multiset can be interpreted as a set where elements can be repeated, or equivalently as lists that are considered equal up to the permutation of elements. We use multisets to measure aspects of a term, and show that these aspects strictly decrease via  $\rightsquigarrow_{(R,D,L)}$  reduction.

**Definition 44** (Multisets). A multiset m is a pair (A, f) where A is a set and  $f: A \to \mathcal{N}$  is a function that maps elements of A to a natural number.

The formal definition of multisets in Definition 44 follows intuition when we consider the function f to tell us the number of occurrences of an element  $x \in A$  in the multiset m.

- **Example 45.** Let  $m = (\{x, y, z\}, f)$  and f(x) = 2, f(y) = 1 and f(z) = 3. Then this multiset can also be written as  $\{x, x, y, z, z, z\}$  or equivalently as  $\{x^2, y^1, z^3\}$ 
  - ▶ Remark 46. The empty multiset is written as {}

We will need to be able to reason about multisets in order to use them as part of our reasoning for strong normalisation. First we discuss the union of multisets, which will be needed when measuring a term recursively, e.g. in an application st we will need to measure aspects of s and unionise them with the multiset corresponding to the measure of the same of t, to obtain the overall measure of the application.

▶ **Definition 47** (Union of Multisets). The union (or sum) of two multisets m = (A, f) and n = (B, g) is the multiset  $m \cup n = (A \cup B, h)$  such that for all  $x \in A \cup B$ , h(x) = f(x) + g(x).

- **Example 48.** Let  $m = \{a^1, b^3, c^2\}$  and  $n = \{c^3, d^1\}$ , then  $m \cup n = \{a^1, b^3, c^5, d^1\}$ 
  - ▶ Remark 49. The notion  $A \cup B$  is the union of the sets and *not* a disjoint union.

To show strong normalisation of sharing reductions, we need to show that aspects of terms that can be represented as multisets strictly decrease during reduction. In order to show this, we need to be able determine when a multiset is larger/smaller than another i.e. we need to be able to apply an ordering.

▶ **Definition 50** (Ordering of Multisets). Given a totally ordered set A and two multisets m = (A, f) and n = (A, g), we say m is strictly larger than n, m > n, if the following conditions hold

1107 •*m* ≠ *n* 

1099

- $\bullet \forall x \in A.(g(x) > f(x) \to \exists y \in A.[(y > x) \land (f(y) > g(y))])$
- **► Example 51.**  $\{1^5, 2^2, 3^1\} < \{1^3, 2^4, 3^3\}$

The *height* of a term is intuitively a multiset of integers that record the scope of each sharing. The scope is measured by the number of constructors from the sharing node to the root of the term in its graphical notation. The formal definition of the height is given in Definition 32. First we prove Lemma 27 on a case-by-case basis.

If 
$$t \leadsto_{(L)} u$$
 then  $\mathcal{H}^i(t) > \mathcal{H}^i(u)$ 

Proof.

$$s[\Gamma]t \leadsto_L (st)[\Gamma]$$

$$\begin{aligned} &\mathcal{H}^{i}(\left(s[\Gamma]\right)t) = \mathcal{H}^{i+1}(s[\Gamma]) \cup \mathcal{H}^{i+1}(t) = \mathcal{H}^{i+1}(s) \cup \mathcal{H}^{i+1}(t) \cup \mathcal{H}^{i+1}([\Gamma]) \cup \{i+1\} \\ &\mathcal{H}^{i}(\left(st\right)[\Gamma]) = \mathcal{H}^{i}(st) \cup \mathcal{H}^{i}([\Gamma]) = \mathcal{H}^{i+1}(s) \cup \mathcal{H}^{i+1}(t) \cup \mathcal{H}^{i}([\Gamma]) \cup \{i\} \end{aligned}$$

$$st[\Gamma] \leadsto_L (st)[\Gamma]$$

This case is similar to the one above and we omit it.

$$d\langle \vec{x} \rangle.t[\Gamma] \leadsto_L (d\langle \vec{x} \rangle.t)[\Gamma] \text{ iff all } \vec{x} \in (t)_{fv}$$

```

The weight of a term is intuitively the number or copies each constructor (abstraction, application and variable) will exist after duplication. Figure 5 illustrates this, by showing a side-by-side comparison of the term

$$x\langle x \rangle.c_1\langle w_1 \rangle.w_1\left(\left(c_2\langle w_2 \rangle.w_2\right)x\right)$$
$$\left[c_1\langle w_1 \rangle c_2\langle w_2 \rangle|y\langle y \rangle \left[w_1, w_2 \leftarrow z\langle z \rangle.z_1\left(z_2y\right)\left[z_1, z_2 \leftarrow z\right]\right]\right]$$

and its equivalent in the  $\Lambda_{\mathcal{W}}$ -calculus obtained by  $[-]^{\mathcal{W}}$ . Each red line shows the connection between the abstraction and application constructors in both calculi. The weight of a constructor is then the number of red lines associated with it, e.g. the weight of the example is the multiset  $\{1^6, 2^4, 4^1\}$ .

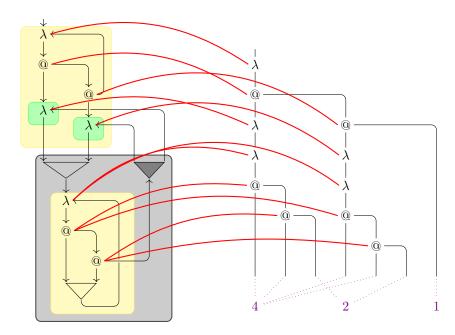

```
Proposition 52. For e \notin \vec{w}, \mathcal{W}^i(t) = \mathcal{W}^i(t\{\vec{w}/e\}_b)
```

Proof. To prove this, first we need to prove that book-keeping does not affect the function  $\mathcal{V}^i(t)$ . We prove this by induction on t.

Base Case: Variable
Vacuously True

Base Case: Abstraction  $\mathcal{V}^{i}(e\langle\vec{y}\rangle.t\{\vec{w}/e\}_{b}) = \mathcal{V}^{i}(e\langle\vec{w}\rangle.t) = \mathcal{V}^{i}(t) \cup \{e \mapsto i\} = \mathcal{V}^{i}(e\langle\vec{y}\rangle.t)$ Base Case: Distributor  $\mathcal{V}^{i}(u[f\langle\vec{z}\rangle|e\langle\vec{y}\rangle[\Gamma]]\{\vec{w}/e\}_{b}) = \mathcal{V}^{i}(u[f\langle\vec{z}\rangle|e\langle\vec{w}\rangle[\Gamma]])$ 1142  $= \mathcal{V}^{i}(u[\Gamma]) \ \{\vec{e}\} = \mathcal{V}^{i}(u[f\langle\vec{z}\rangle|e\langle\vec{y}\rangle[\Gamma]])$ 1143
Inductive Case: Application

 $\mathcal{V}^{i}(st\{\vec{w}/e\}_{b}) = \mathcal{V}^{i}((s\{\vec{w}/e\}_{b})t\{\vec{w}/e\}_{b}) = \mathcal{V}^{i}(s\{\vec{w}/e\}_{b}) \cup \mathcal{V}^{i}(t\{\vec{w}/e\}_{b}) \stackrel{\text{I.H.}^{2}}{=} \mathcal{V}^{i}(s) \cup \mathcal{V}^{i}(t) = \mathcal{V}^{i}(st)$ 

**Figure 5** The weight is the multiset of incoming red arcs for each application and abstraction; here  $\{1^5, 2^3\}$ , together with the number of purple dotted lines for each variable; here  $\{1, 2, 4\}$ . Thus the overall weight is  $\{1^6, 2^4, 4\}$

where  $\mathcal{V}^{i}(u)(\vec{w}) = \mathcal{V}^{i}(u)(w_{1}) + \dots + \mathcal{V}^{i}(u)(w_{n})$  and  $\vec{w} = \{w_{1}, \dots, w_{n}\}$ 

Lifting and Compound

$$u[\vec{w} \leftarrow y][\vec{x} \cdot y \leftarrow t] \leadsto_C u[\vec{x} \cdot \vec{w} \leftarrow t]$$

$$\mathcal{W}^{i}(u[\vec{w} \leftarrow y][\vec{x} \cdot y \leftarrow t]) = \mathcal{W}^{i}(u[\vec{w} \leftarrow y]) \cup \mathcal{W}^{j}(t)$$
where  $j = \mathcal{V}^{i}(u[\vec{w} \leftarrow y])(\vec{x}) + \mathcal{V}^{i}(u[\vec{w} \leftarrow y])(y) = \mathcal{V}^{i}(u[\vec{w} \leftarrow y])(\vec{x}) + \mathcal{V}^{i}(u)(\vec{w})$ 

$$= \mathcal{W}^{i}(u) \cup \mathcal{W}^{j}(t) = \mathcal{W}^{i}(u[\vec{x} \cdot \vec{w} \leftarrow t])$$

$$u[x \leftarrow t] \leadsto_C u\{t/x\}$$

1216 
$$\mathcal{W}^i(u[x \leftarrow t]) = \mathcal{W}^i(u) \cup \mathcal{W}^j(t)$$

where  $j = \mathcal{V}^i(u)(x)$ 

$$\mathcal{W}^i(u\{t/x\}) = \mathcal{W}^i(u) \cup \mathcal{W}^{\mathcal{V}^i(u)(x)}(t)$$

1219

For the other lifting rules, we show that  $V^i(u[\Gamma])$  outputs the same integers before and after lifting for each variable bounded by  $[\Gamma]$ . Then we can know it produces some multiset M.

$$(s[\Gamma]) t \leadsto_L (st)[\Gamma]$$

$$\mathcal{W}^{i}((s[\Gamma])t) = \mathcal{W}^{i}(s[\Gamma]) \cup \mathcal{W}^{i}(t) = \mathcal{W}^{i}(s) \cup \mathcal{W}^{i}(t) \cup M_{1}$$

$$\mathcal{W}^{i}((st)[\Gamma]) = \mathcal{W}^{i}(st) \cup M_{2} = \mathcal{W}^{i}(s) \cup \mathcal{W}^{i}(t) \cup M_{2}$$

$$\mathcal{W}^{i}(st) = \mathcal{W}^{i}(st) \cup \mathcal{W$$

 $M_1 = M_2$  since  $\mathcal{V}^i(s)(x) = \mathcal{V}^i(st)(x)$  for  $x \in (s)_{fv}$  and  $[\Gamma]$  only binds variables in s.

$$st[\Gamma] \leadsto_L (st)[\Gamma]$$

This case is very similar to the one above and we omit it.

$$d\langle \vec{x} \rangle . t[\Gamma] \leadsto_L (d\langle \vec{x} \rangle . t)[\Gamma] \text{ iff all } \vec{x} \in (t)_{fv}$$

Case 1:

$$\mathcal{W}^{i}(d\langle d \rangle.(t[\Gamma])) = \mathcal{W}^{i}(t[\Gamma]) \cup \{i, \mathcal{V}^{i}(t[\Gamma])(d)\} = \mathcal{W}^{i}(t) \cup M_{1} \cup \{i, \mathcal{V}^{i}(t)(d)\}$$
$$\mathcal{W}^{i}((d\langle d \rangle.t)[\Gamma]) = \mathcal{W}^{i}(d\langle d \rangle.t) \cup M_{2} = \mathcal{W}^{i}(t) \cup M_{2} \cup \{i, \mathcal{V}^{i}(t)(d)\}$$

 $M_1 = M_2$  since  $\mathcal{V}^i(t)(x) = \mathcal{W}^i(d\langle d \rangle.t)(x)$  where  $x \neq d$  and d is not bound by  $[\Gamma]$  Case 2:

$$\mathcal{W}^{i}(d\langle \vec{x} \rangle.(t[\sigma])) = \mathcal{W}^{i}(t[\sigma]) \cup \{i\} = \mathcal{W}^{i}(t) \cup M_{1} \cup \{i\}$$

$$\mathcal{W}^{i}((d\langle \vec{x} \rangle.t)[\sigma]) = \mathcal{W}^{i}(d\langle \vec{x} \rangle.t) \cup M_{2} = \mathcal{W}^{i}(t) \cup M_{2} \cup \{i\}$$

 $M_1 = M_2$  since  $\mathcal{V}^i(t)(x) = \mathcal{W}^i(d\langle \vec{x} \rangle, t)(x)$  where  $x \neq d$  and d is not bound by  $[\Gamma]$ 

$$u[\vec{x} \leftarrow t[\Gamma]] \leadsto_L u[\vec{x} \leftarrow t][\Gamma]$$

Case 1:

$$\mathcal{W}^i(u[\vec{x} \leftarrow t[\Gamma]]) = \mathcal{W}^i(u) \cup \mathcal{W}^j(t[\Gamma]) = \mathcal{W}^i(u) \cup \mathcal{W}^j(t) \cup M_1$$

where 
$$j = \mathcal{V}^i(u)(x_1) + \cdots + \mathcal{V}^i(u)(x_n)$$

$$\mathcal{W}^{i}(u[\vec{x} \leftarrow t][\Gamma]) = \mathcal{W}^{i}(u[\vec{x} \leftarrow t]) \cup M_{2} = \mathcal{W}^{i}(u) \cup \mathcal{W}^{j}(t) \cup M_{2}$$

 $M_1 = M_2$  since  $\mathcal{V}^j(t)(x) = \mathcal{V}^i(u[\vec{x} \leftarrow t])(x)$  for  $x \in (t)_{fv}$  and  $[\Gamma]$  only binds variables in t Case 2:

$$\mathcal{W}^{i}(u[\leftarrow t[\Gamma]]) = \mathcal{W}^{i}(u) \cup \mathcal{W}^{1}(t[\Gamma]) = \mathcal{W}^{i}(u) \cup \mathcal{W}^{1}(t) \cup M_{1}$$

$$\mathcal{W}^i(u[\leftarrow t][\Gamma]) = \mathcal{W}^i(u[\leftarrow t]) \cup M_2 = \mathcal{W}^i(u) \cup \mathcal{W}^1(t) \cup M_2$$

 $M_1 = M_2$  since  $\mathcal{V}^1(t)(x) = \mathcal{V}^i(u[\leftarrow t])(x)$  for  $x \in (t)_{fv}$  and  $[\Gamma]$  only binds variables in t

$$u[e_1\langle \vec{w}_1 \rangle \dots e_n \langle \vec{w}_n \rangle | c \langle \vec{x} \rangle \overline{[\Gamma]} [\vec{y} \leftarrow t]] \leadsto_L$$

$$u\{(\vec{w}_1/\vec{y})/e_1\}_b \dots \{(\vec{w}_n/\vec{y})/e_n\}_b [e_1\langle \vec{w}_1/\vec{y} \rangle \dots e_n \langle \vec{w}_n/\vec{y} \rangle | c \langle \vec{x} \rangle \overline{[\Gamma]}] [\vec{y} \leftarrow t]$$

$$u[e_1\langle \vec{w}_1 \rangle \dots e_n \langle \vec{w}_n \rangle | c\langle \vec{x} \rangle \overline{[\Gamma]} [\overline{f\langle \vec{z} \rangle} | d\langle \vec{a} \rangle \overline{[\Gamma']}]] \leadsto_L$$

$$u\{(\vec{w}_1/\vec{z})/e_1\}_b \dots \{(\vec{w}_n/\vec{z})/e_n\}_b [e_1\langle \vec{w}_1/\vec{z} \rangle \dots e_n\langle \vec{w}_n/\vec{z} \rangle | c\langle \vec{x} \rangle \overline{[\Gamma]}] [\overline{f\langle \vec{z} \rangle} | d\langle \vec{a} \rangle \overline{[\Gamma']}]$$

Since book-keeping operations do not affect the weight of a term (Proposition 52), we simplify these two rules into one, where u' is u with some book-keepings applied.

*Note*: Proposition 52 is relevant here since the book-keepings produced by this rule cannot be of the form  $\{e/e\}_b$  without breaking linearity.

$$u[e_1\langle \vec{w_1}\rangle \dots e_n\langle \vec{w_n}\rangle | c\langle \vec{x}\rangle \overline{[\Gamma]} [\Gamma]] \leadsto_L u'[e_1\langle \vec{z_1}\rangle \dots e_n\langle \vec{z_1}\rangle | c\langle \vec{x}\rangle \overline{[\Gamma]}] [\Gamma]$$

```
