1 Introduction

We investigate the computational meaning of the following *switch* rule of deep-inference proof theory [19, 10]:

$$\frac{(A \to B) \wedge C}{A \to (B \wedge C)}\, s$$

On its own, it corresponds to an *end-of-scope* marker in λ-calculus. This is a special annotation of a subterm, to indicate that a given variable does not occur free, so that a substitution on that variable can be aborted early. In the above rule, A corresponds to the binding variable of an abstraction and C to the subterm of said abstraction where it doesn't occur, while B represents those subterms where it does occur.

The main thrust of our work is to incorporate this rule, and its computational interpretation as a term construct, into the *atomic λ-calculus* [12]. This calculus results from an investigation of the following *medial* rule:

$$\frac{(A \vee B) \to (C \wedge D)}{(A \to C) \wedge (B \to D)}\, m$$

The medial rule enables duplication to proceed *atomically*: on individual constructors (abstraction and application) rather than entire subterms. The atomic λ-calculus implements *full laziness*, a standard notion of sharing where only the *skeleton* of a term needs to be duplicated. Given a term t which needs to be duplicated, full laziness allows to share all maximal subterms $u_1, \ldots, u_k$ of t that do not contain occurrences of a variable bound in t outside u_i. The constructors in t not in any u_i are then part of the skeleton.

Our investigation is then focused on the interaction of switch and medial. Based on this we develop the *spinal atomic λ-calculus*, a natural evolution of the atomic λ-calculus. The new calculus improves on full laziness with *spinal full laziness*, which duplicates the *spine* rather than the skeleton. The spine of an abstraction are the direct paths from the binder to bound variables [1]. The graph below provides an example of this for the term $\lambda x.(\lambda z.z)\lambda y.(yy)x$, where the spine of λx is the very thick red line and the largest subterms that could be identied by an end-of-scope operator in the term calculus (or the switch rule in the proof theory) are enclosed by yellow boxes.
1.1 Related Work

Spine duplication has been implemented by Blanc et al. in [4], by making use of labels in a dag-implementation. The main purpose of their work is to study sharing in Wadsworth's *weak λ-calculus* [21] (further studied in [6]). Balabonski [1] showed that spine duplication allows for an optimal reduction in the sense of Lévy [17] for *weak reduction* i.e. where a β-reduction $(\lambda x.t)s$ occurring in a subterm u can only reduce if all free variables in the redex are also free in the term u. Blelloch and Greiner [5] showed that the weak call-by-value reduction strategy can be implemented in polynomial time with respect to the size of the initial term and the number of β steps in said term. Given the restriction that u is a closed term, this is then the same as *closed reduction* [7, 8]. Our work generalizes spine duplication to the λ-calculus. It uses environments to implement sharing, and does not make use of labels, while maintaining a close intuition to dag-implementations.

End-of-scope markers in the λ-calculus have been seen throughout literature. *Berkling's lambda bar* [2] has shown to remove the need for variable names while maintaining correctness; improving efficiency by removing the need for alpha conversion [3]. This result was generalized by *Adbmal* (invert of "Lambda") [14]. It was shown by using multiple variables, scopes can be sequenced rather than nested which correspond closely to the boxes in MELL proof nets of linear logic [16]. This approach was studied further in [20] as graph reduction that satisfies optimality [17]. Although these approaches could identify the skeleton of a term, none however identify the spine of a term, which meant the scopes explicitly displayed may be larger than necessary from the perspective of performing substitution. This problem was solved by *director strings*, introduced by Kennaway and Sleep in [15] for combinator reduction and then generalized for any strategy by Fernández et al. in [9]. Director strings are an annotation on terms detailing the location of variable occurrences. An apt annotation on the body of an abstraction will consequently identify the spine of it. Despite being implementations that use director strings [18, 9, 8], an implementation with sharing techniques allowing for duplicating solely the spine could not be found.

Introduce the rest of the paper.

2 Deep Inference

Deep inference is a methodology for designing proof systems. Inference rules in deep inference, such as switch and medial, can be applied 'deeply' i.e. there is no concept of the main connective of a formula. The *open deduction* formalism [11] is designed around this principle, where logical connectives can be applied at the level of derivations as well as formulae. A derivation from premise A to conclusion C (over the connectives conjunction and implication) is constructed as follows,

▶ **Definition 1.** *A* derivation *in open deduction is defined as follows.*

$$
\begin{array}{c} A \\ \| \\ C \end{array}
\;\; ::= \;\;
A \;\; | \;\;
\begin{array}{c} A_1 \\ \| \\ C_1 \end{array} \wedge \begin{array}{c} A_2 \\ \| \\ C_2 \end{array}
\;\; | \;\;
\begin{array}{c} C_1 \\ \| \\ A_1 \end{array} \to \begin{array}{c} A_2 \\ \| \\ C_2 \end{array}
\;\; | \;\;
\begin{array}{c} A \\ \| \\ \dfrac{B_1}{B_2}\, r \\ \| \\ C \end{array}
$$

where from left to right, (1) the premise and the conclusion can be the same formula i.e. $A = C$. (2) We can compose derivations horizontally with a conjunction $\wedge$, where $A = A_1 \wedge A_2$ and $C = C_1 \wedge C_2$. (3) We can compose derivations horizontally with an implication $\to$ where $A = A_1 \to A_2$ and $C = C_1 \to C_2$. Note that the derivation on the antecedent of the implication is inverted; it can be interpreted as a derivation where we treat the premise as the conclusion and the conclusion as the premise. Lastly (4) derivations can be composed vertically with an inference rule r from B_1 to B_2. We work modulo symmetry, associativity, and unit laws of conjunction. Additionally the generic vertical composition of two derivations (without a mediating rule) exists as a derived operation in [11].

Open deduction was used to type the *basic calculus*, which was introduced in [12] as a basis for the atomic λ-calculus. We follow the same approach here; we reintroduce the basic calculus and show its typing system can be extended with the switch rule, and later expand on this to introduce the spinal atomic λ-calculus. We obtain a formulation of minimal logic together with the switch rule, from embedding its usual natural deduction system into open deduction. The rules are (respectively) called abstraction, switch, application and (n-ary) contraction from left to right.

$$
\frac{\top}{A \to A}\,\lambda \qquad
\frac{(A \to B) \wedge C}{A \to (B \wedge C)}\,s \qquad
\frac{A \wedge (A \to B)}{B}\,@ \qquad
\frac{A}{A \wedge \cdots \wedge A}\,\vartriangle
$$

These rules are used to type terms of the *basic calculus*, given by the grammar

▶ **Definition 2.** $\quad s, t \;\; ::= \;\; x \;\; | \;\; \lambda x.t \;\; | \;\; s\,t \;\; | \;\; s[x_1, \ldots, x_n \leftarrow t]$

where the four constructors are called, from left to right, variable, abstraction, application and sharing. This is a *linear* calculus, so each variable occurs at most once, and a sharing construct is used to represent multiple occurrences of a variable (or term). The variable bound by an abstraction must occur within the body of the abstraction i.e. in the term $\lambda x.t$, $x \in (t)_{fv}$. Lastly and similarly, each variable bound by the sharing construct must occur and become bound i.e. in the term $s[x_1, \ldots, x_n \leftarrow t]$, each $x_i \in (u)_{fv}$ for all $1 \le i \le n$.

For a given set $\{a, b, c, \ldots\}$ of *atomic formulae*, the following two grammars define *minimal formulae* and *conjunctive formulae* respectively.

$$
A, B, C \;\; ::= \;\; a \mid A \to B \qquad\qquad \Gamma, \Delta \;\; ::= \;\; A \mid \top \mid \Gamma \wedge \Delta
$$

The typing derivations in open deduction for this calculus is displayed in Figure 1, where the corresponding types and derivations for terms are in red. We add the boxes to aid the reader see the horizontal composition of derivations. The colour of the box has no meaning other than to help identify derivations. A variable x may be typed by any minimal formula A, while the other constructors each correspond to inference rules, used within the context of further derivations. A term t with free variables $x_1, \ldots, x_n$ can be typed by a derivation from assumption $A_1^{x_1} \wedge \cdots \wedge A_n^{x_n}$ to conclusion C. A *typing judgement* $t : C$ then expresses that t is typeable by a derivation with conclusion C. Note that a derivation occurring as the antecedent of an implication is always a minimal formula.
Figure 1 Typing derivations for terms in the basic calculus

The semantics of the basic calculus, including the compilation and readback into the λ-calculus, can be found in [12] and will not be repeated here.

Although in the derivation for an abstraction in Figure 1 we place the switch rule directly after the abstraction rule, this is not always the case. Consider the term $t = \lambda x.\lambda y.xy$, where $x : A \to B = C$ and $y : A$. The following derivations are both typing judgements of $t : C \to A \to B$.
The main difference between the two is that the first is *scope-balanced* while the second is *unbalanced* (terminology taken from [14]). In derivations, the *scope* of an abstraction is considered to be the subderivation found underneath the corresponding switch rule. In the scope-balanced derivation, the scope of the binder λx is the whole body of the term; any scopes of any binders underneath λx (such as λy) are considered nested within the scope of λx. The scope of an abstraction in the scope-balanced derivation corresponds to the skeleton of the term. In the unbalanced derivation, scopes are not strictly nested but can overlap. The variable y (with type A) is now identified by the switch rule corresponding with λx, and is not considered within the scope of λx in contrast to the balanced derivation where is was nested. The unbalanced scope of an abstraction corresponds with the spine of the term. Both derivations identify the application in all scope.

The atomic λ-calculus can be seen as using only scope-balanced derivations, and here we show that by using unbalanced derivations we can identify the spine of an abstraction, and moreover when introducing the medial rule to the typing system duplicate said spine by proof normalisation.

3 The Spinal Atomic λ-Calculus

We now formally introduce the syntax of the spinal atomic λ-calculus (Λ_a^S).

▶ **Definition 3** (Pre-Terms). *The pre-terms $t \in \Lambda_a^S$ are defined by the following syntax*

$$t \quad ::= \quad x \quad | \quad t\,t \quad | \quad x\langle\,\vec{y}\,\rangle.t \quad | \quad t[\Gamma]$$

$$[\Gamma] \quad ::= \quad [\vec{x} \leftarrow t] \quad | \quad [e_1\langle\,\vec{x_1}\,\rangle\ldots e_n\langle\,\vec{x_n}\,\rangle\,|\,d\langle\,\vec{y}\,\rangle\,\overline{[\Gamma]}]$$

$$\overline{[\Gamma]} \quad ::= \quad [\Gamma] \quad | \quad \overline{[\Gamma]}[\Gamma]$$

We write $\vec{x}$ for a sequence of variables $x_1, \ldots, x_n$ for $n \geq 0$. An abstraction $x\langle\,x\,\rangle.t$ and a phantom-abstraction $x\langle\,\vec{y}\,\rangle.t$ are two instances of the same construct. We call the variables inside the brackets the *cover* of the abstraction. If the cover is the same as the preceeding variable, then we consider it to be an abstraction, otherwise it is a phantom-abstraction and we call the preceeding variable a *phantom-variable*. The distributor $u[e_1\langle\,\vec{x_1}\,\rangle\ldots e_n\langle\,\vec{x_n}\,\rangle\,|\,d\langle\,\vec{y}\,\rangle\,\overline{[\Gamma]}]$ captures the phantom-variables $e_1, \ldots, e_n$ in u and the covers associated with those phantom-variables are captured by the environment $\overline{[\Gamma]}$, which is a collection of closures $[\Gamma]$. We sometimes write the distributor as $u[\overrightarrow{e\langle\,x\,\rangle}\,|\,d\langle\,\vec{y}\,\rangle\,\overline{[\Gamma]}]$ when we are not concerned about the binding of phantom-variables. Terms are then pre-terms with sensible and correct bindings. To define terms, we first define *free* and *bound* variables and phantom variables.

▶ **Definition 4** (Free and Bound Variables). *The free variables $(-)_{fv}$ and bound variables $(-)_{bv}$ of a pre-term t is defined as follows*

$$(x)_{fv} = \{x\} \qquad\qquad\qquad (x)_{bv} = \{\}$$

$$(s\,t)_{fv} = (s)_{fv} \cup (t)_{fv} \qquad\qquad (s\,t)_{bv} = (s)_{bv} \cup (t)_{bv}$$

$$(x\langle\,x\,\rangle.t)_{fv} = (t)_{fv} - \{x\} \qquad\qquad (x\langle\,x\,\rangle.t)_{bv} = (t)_{bv} \cup \{x\}$$

$$(c\langle\,\vec{x}\,\rangle.t)_{fv} = (t)_{fv} \qquad\qquad\qquad (c\langle\,\vec{x}\,\rangle.t)_{bv} = (t)_{bv}$$

$$(u[\vec{x} \leftarrow t])_{fv} = (u)_{fv} \cup (t)_{fv} - \{\vec{x}\} \qquad (u[\vec{x} \leftarrow t])_{bv} = (u)_{bv} \cup (t)_{bv} \cup \{\vec{x}\}$$

$$(u[\overrightarrow{e\langle\,x\,\rangle}\,|\,c\langle\,c\,\rangle\,\overline{[\Gamma]}])_{fv} = (u\overline{[\Gamma]})_{fv} - \{c\} \qquad (u[\overrightarrow{e\langle\,x\,\rangle}\,|\,c\langle\,c\,\rangle\,\overline{[\Gamma]}])_{bv} = (u\overline{[\Gamma]})_{bv}$$

$$(u[\overrightarrow{e\langle\,x\,\rangle}\,|\,c\langle\,\vec{y}\,\rangle\,\overline{[\Gamma]}])_{fv} = (u\overline{[\Gamma]})_{fv} \cup \{c\} \qquad (u[\overrightarrow{e\langle\,x\,\rangle}\,|\,c\langle\,\vec{y}\,\rangle\,\overline{[\Gamma]}])_{bv} = (u\overline{[\Gamma]})_{bv}$$

▶ **Definition 5** (Free and Bound Phantom-Variables). *The free phantom-variables $(-)_{fp}$ and bound phantom-variables $(-)_{bp}$ of the pre-term t is defined as follows*

$$(x)_{fp} = \{\} \qquad\qquad\qquad (x)_{bp} = \{\}$$

$$(s\,t)_{fp} = (s)_{fp} \cup (t)_{fp} \qquad\qquad (s\,t)_{bp} = (s)_{bp} \cup (t)_{bp}$$

$$(x\langle\,x\,\rangle.t)_{fp} = (t)_{fp} \qquad\qquad\qquad (x\langle\,x\,\rangle.t)_{bp} = (t)_{bp}$$

$$(c\langle\,\vec{x}\,\rangle.t)_{fp} = (t)_{fp} \cup \{c\} \qquad\qquad (c\langle\,\vec{x}\,\rangle.t)_{bp} = (t)_{bp}$$

$$(u[\vec{x} \leftarrow t])_{fp} = (u)_{fp} \cup (t)_{fp} \qquad\qquad (u[\vec{x} \leftarrow t])_{bp} = (u)_{bp} \cup (t)_{bp}$$

$$(u[e_1\langle\,\vec{x_1}\,\rangle\ldots e_n\langle\,\vec{x_n}\,\rangle\,|\,c\langle\,c\,\rangle\,\overline{[\Gamma]}])_{fp} = (u\overline{[\Gamma]})_{fp} - \{e_1, \ldots, e_n\}$$

$$(u[e_1\langle\,\vec{x_1}\,\rangle\ldots e_n\langle\,\vec{x_n}\,\rangle\,|\,c\langle\,c\,\rangle\,\overline{[\Gamma]}])_{bp} = (u\overline{[\Gamma]})_{bp} \cup \{e_1, \ldots, e_n\}$$

$$(u[e_1\langle\,\vec{x_1}\,\rangle\ldots e_n\langle\,\vec{x_n}\,\rangle\,|\,c\langle\,\vec{y}\,\rangle\,\overline{[\Gamma]}])_{fp} = (u\overline{[\Gamma]})_{fp} \cup \{c\} - \{e_1, \ldots, e_n\}$$

$$(u[e_1\langle\,\vec{x_1}\,\rangle\ldots e_n\langle\,\vec{x_n}\,\rangle\,|\,c\langle\,\vec{y}\,\rangle\,\overline{[\Gamma]}])_{bp} = (u\overline{[\Gamma]})_{bp} \cup \{e_1, \ldots, e_n\}$$

Variables are bound by abstractions (not phantoms) and sharings. Phantom-variables are bound by distributors. With these definitions, we can formally define the terms of Λ_a^S.

▶ **Definition 6** (Terms). *A term $t \in \Lambda_a^S$ is a pre-term with the following constraints*

1. *Each variable may occur at most once.*

2. *In an abstraction $x\langle x \rangle.t$, $x \in (t)_{fv}$.*

3. *In a phantom-abstraction $c\langle x_1, \ldots, x_n \rangle.t$, $\{x_1, \ldots, x_n\} \subset (t)_{fv}$.*

4. *In a sharing $u[x_1, \ldots, x_n \leftarrow t]$, $\{x_1, \ldots, x_n\} \subset (u)_{fv}$.*

5. *In a distributor $u[e_1\langle w_1^1, \ldots, w_{k_1}^1 \rangle \ldots e_n\langle w_1^n, \ldots, w_{k_n}^n \rangle | c\langle c \rangle \overline{[\Gamma]}]$*

    a. *For all $1 \le i \le n$ and $1 \le m \le k_n$, $w_m^i (u)_{fv}$ and becomes bound by $\overline{[\Gamma]}$.*

    b. *$\{e_1\langle w_1^1, \ldots, w_{k_1}^1 \rangle, \ldots, e_n\langle w_1^n, \ldots, w_{k_n}^n \rangle\} \subset (u)_{fc}$, and $\{e_1, \ldots, e_n\} \subset (u)_{fp}$, and each e_i becomes bound.*

    c. *The variable c occurs somewhere in the environments $\overline{[\Gamma]}$.*

6. *In a distributor $u[e_1\langle w_1^1, \ldots, w_{k_1}^1 \rangle \ldots e_n\langle w_1^n, \ldots, w_{k_n}^n \rangle | c\langle y_1, \ldots, y_m \rangle \overline{[\Gamma]}]$*

    a. *Both 5(a) and 5(b) hold.*

    b. *For all $1 \le i \le m$, y_i occurs in the environments $\overline{[\Gamma]}$.*

We consider terms equal up to the congruence induced by the exchange of closures. Consider the term $t[\Gamma_1][\Gamma_2]$ where $[\Gamma_1]$ and $[\Gamma_2]$ are both closures. Then $t[\Gamma_1][\Gamma_2] \sim t[\Gamma_2][\Gamma_1]$ iff $[\Gamma_2]$ only binds variables and phantom-variables located in t. This equivalence is essential to the rewriting theory. We also consider terms equal up to symmetry of contraction. We consider the sequence of variables xs modulo permutations. Let $\vec{x}$ be a list of variables and let $\vec{x_P}$ be a permutation of that list, then the following terms are considered equal.

$$u[\vec{x} \leftarrow t] \sim u[\vec{x_P} \leftarrow t] \qquad c\langle \vec{x} \rangle.t \sim c\langle \vec{x_P} \rangle.t$$

3.1 Typing System
■ **Figure 2** Typing derivations for phantom-abstractions and distributors

The terms typed by the derivations in Figure 1 and Figure 2. Figure 2 shows the derivations for the terms $d\langle \vec{x} \rangle.t$ and $u[e_1\langle \vec{x_1} \rangle \ldots e_n\langle \vec{x_n} \rangle | c\langle c \rangle \overline{[\Gamma]}]$. The distributor construct is typed using the medial rule as in [12]. Notice that the medial rule in Figure 2 does not use disjunction compared to the medial rule in the introduction. In the derivation we combine the medial rule with a co-contraction rule to form the *distribution rule* (d). Since the formula in the ante-cedent of an implication is always a minimal formula, doing this allows us to avoid introducing disjunction into the typing system.

The main difference between our calculus is the bindings. We create a new class of bindings, where phantom-variables are captured by the distributor but variables are captured

by the environment of the distributor. This shows in the derivations since the types of the variables (Σ and Φ) are not captured by the distribution rule.

3.2 Compilation and Readback

We now define the translations between Λ_a^S and the original λ-calculus. First we define the interpretation $\Lambda \to \Lambda_a^S$ (*compilation*). Intuitively, it replaces each abstraction $\lambda x.-$ with the term $x\langle x \rangle. - [x_1, \ldots, x_n \leftarrow x]$ where $x_1, \ldots, x_n$ replace the occurrences of x. Actual substitutions are denoted as $\{t/x\}$. Let $|M|_x$ denote the number of occurrences of x in M, and if $|M|_x = n$ let $M\frac{n}{x}$ denote M with the occurrences of x by fresh, distinct variables $x^1, \ldots, x^n$. First, the translation of a *closed* term M is $(\!|M|\!)'$, defined below

▶ **Definition 7** (Compilation). *The interpretation for closed lambda terms,* $(\!|\Lambda|\!)' : \Lambda \to \Lambda_a^S$ *is defined below*

$$(\!|x|\!)' = x$$

$$(\!|M\,N|\!)' = (\!|M|\!)'\,(\!|N|\!)'$$

$$(\!|\lambda x.M|\!)' = \begin{cases} x\langle x \rangle.(\!|M|\!)' & \text{if } |M|_x = 1 \\ x\langle x \rangle.(\!|M\frac{n}{x}|\!)'[x^1, \ldots, x^n \leftarrow x] & \text{if } |M|_x = n \neq 1 \end{cases}$$

For an arbitrary term M, if $x_1, \ldots, x_k$ are the free variables of M such that $|M|_{x_i} = n_i > 1$, the translation $(\!|M|\!)$ is

$$(\!|M\frac{n_1}{x_1} \ldots \frac{n_k}{x_k}|\!)'[x_1^1, \ldots, x_1^{n_1} \leftarrow x_1] \ldots [x_k^1, \ldots, x_k^{n_k} \leftarrow x_k]$$

The readback into the λ-calculus is slightly more complicated, specifically due to the bindings induced by the distributor. Interpreting a distributor $[\![u[e_1\langle \vec{x_1} \rangle \ldots e_n\langle \vec{x_n} \rangle | c\langle c \rangle \overline{[\Gamma]}]]\!]$ construct as a λ-term requires (1) converting the phantom-abstractions it binds in u into abstractions (2) collapsing the environment (3) maintaining the bindings between the converted abstractions and the intended variables located in the environment.

▶ **Definition 8.** *Given a total function σ with domain D and codomain C, we* overwrite *the function with case $x \mapsto V$ where $x \in D$ and $V \in C$ such that*

$$\sigma[x \mapsto V](z) = \begin{cases} V & z = x \\ \sigma(z) & \text{otherwise} \end{cases}$$

When using the map σ as part of the translation, the intuition is that for all bound variables x in the term we are translatings, it should be that $\sigma(x) = x$. The map $\gamma : V \to V$ is defined similarly, and the purpose is to keep track of the binding of phantom-variables.

▶ **Definition 9.** *The interpretation $[\![- | - | -]\!] : \Lambda_a^S \times (V \to \Lambda) \times (V \to V) \to \Lambda$ is defined as*

$$[\![x | \sigma | \gamma]\!] = \sigma(x)$$

$$[\![s\,t | \sigma | \gamma]\!] = [\![s | \sigma | \gamma]\!]\,[\![t | \sigma | \gamma]\!]$$

$$[\![c\langle c \rangle.t | \sigma | \gamma]\!] = \lambda c.[\![t | \sigma[c \mapsto c] | \gamma]\!]$$

$$[\![c\langle x_1, \ldots, x_n \rangle.t | \sigma | \gamma]\!] = \lambda c.[\![t | \sigma[x_i \mapsto \sigma(x_i)\{c/\gamma(c)\}]_{i \in [n]} | \gamma]\!]$$

$$[\![u[x_1, \ldots, x_n \leftarrow t] | \sigma | \gamma]\!] = [\![u | \sigma[x_i \mapsto [\![t | \sigma | \gamma]\!]]_{i \in [n]} | \gamma]\!]$$

253
$$\llbracket u[e_1\langle \vec{w_1} \rangle, \ldots, e_n\langle \vec{w_n} \rangle \,|\, c\langle c \rangle \overline{[\Gamma]}] \,|\, \sigma \,|\, \gamma \rrbracket = \llbracket u\overline{[\Gamma]} \,|\, \sigma \,|\, \gamma[e_i \mapsto c]_{i\in[n]} \rrbracket$$

254
$$\llbracket u[e_1\langle \vec{w_1} \rangle, \ldots, e_n\langle \vec{w_n} \rangle \,|\, c\langle x_1, \ldots, x_m \rangle \overline{[\Gamma]}] \,|\, \sigma \,|\, \gamma \rrbracket = \llbracket u\overline{[\Gamma]} \,|\, \sigma' \,|\, \gamma[e_i \mapsto c]_{i\in[n]} \rrbracket$$

255
$$\text{where } \sigma' = \sigma[x_i \mapsto \sigma(x_i)\{c/\gamma(c)\}]_{i\in[n]}$$

256
257

258 ▶ **Lemma 10.** *For $s, t \in \Lambda_a^S$, if $s \sim t$ then $\llbracket s \rrbracket = \llbracket t \rrbracket$*

▶ **Lemma 11.** *For a closed $t \in \Lambda_a^S$, where t has no distributor constructs and only variables are shared, and a closed $N \in \Lambda$. the following*

$$\llbracket (\!| N |\!)' \rrbracket = N \qquad\qquad (\!| \llbracket t \rrbracket |\!)' = t \qquad\qquad \exists_{M\in\Lambda}.t = (\!| M |\!)'$$

259   3.3   Rewrite Rules

260 Both the spinal atomic λ-calculus and the atomic λ-calculus of [12] follow atomic reduction
261 steps, i.e. they apply on individual constructors. The biggest difference is that our calculus
262 is capable of duplicating not only the skeleton but also the spine. The rewrite rules in our
263 calculus make use of 3 operations, *substitution*, *book-keeping*, and *exorcism*.

264 The operation *substitution $t\{s/x\}$* propagates through the term t, and replaces the free
265 occurences of the variable x with the term s. Moreover, if x occurs in the cover of a phantom-
266 variable $e\langle \vec{y} \cdot x \rangle$, then substitution replaces the x in the cover with $(s)_{fv}$, $e\langle \vec{y} \cdot (s)_{fv} \rangle$.

267 Although substitution performs some book-keeping on phantom-abstractions, we define
268 an explicit notion of book-keeping $\{\vec{y}/e\}_b$ that updates the variables stored in a free cover i.e.
269 for a term t, $e\langle \vec{x} \rangle \in (t)_{fc}$ then $e\langle \vec{y} \rangle \in (t\{\vec{y}/e\}_b)_{fc}$.

270 The last operation we introduce is called *exorcism $\{c\langle \vec{x} \rangle\}_e$*. We perform exorcisms on
271 phantom-abstractions to convert them to abstractions. Intuitively, this will be performed on
272 phantom-abstractions with phantom-variables bound to a distributor when said distributor is
273 eliminated. It converts phantom-abstractions to abstractions by introducing a sharing of the
274 phantom-variable that captures the variables in the cover, i.e. $c\langle \vec{x} \rangle.t\{c\langle \vec{x} \rangle\}_e = c\langle c \rangle.t[\vec{x} \leftarrow c]$.

275 ▶ **Proposition 12.** *Given $M \in \Lambda$ such that for all $v \in V$, $\gamma(v) \notin (M)_{fv}$ and $\sigma(x) = x$, the*
276 *translation $\llbracket u \,|\, \sigma \,|\, \gamma \rrbracket$ commutes with substitution $\{M/x\}$ in the following way*

$$\llbracket u\{t/x\} \,|\, \sigma \,|\, \gamma \rrbracket = \llbracket u \,|\, \sigma[x \mapsto \llbracket t \,|\, \sigma \,|\, \gamma \rrbracket] \,|\, \gamma \rrbracket$$

277 ▶ **Proposition 13.** *Book-keeping commutes with the translation in the following way*
278 *if $c\langle y_1, \ldots, y_m \rangle. \in (u)_{fc}$ such that $\{x_1, \ldots, x_n\} \subset \{y_1, \ldots, y_m\}$*
279 *and for those $z \in \{y_1, \ldots, y_m\}/\{x_1, \ldots, x_n\}$, $\gamma(c) \notin (\sigma(z))_{fv}$*
280 *or if simply $\{x_1, \ldots, x_n\} \cap (u)_{fv} = \{\}$*

$$\llbracket u\{x_1, \ldots, x_n/c\}_b \,|\, \sigma \,|\, \gamma \rrbracket = \llbracket u \,|\, \sigma \,|\, \gamma \rrbracket$$

281 ▶ **Proposition 14.** *Exorcisms commute with the translation in the following way*
282 *if $c\langle x_1, \ldots, x_n \rangle. \in (u)_{fc}$ or $\{x_1, \ldots, x_n\} \cap (u)_{fv} = \{\}$*

$$\llbracket u\{c\langle x_1, \ldots, x_n \rangle\}_e \,|\, \sigma \,|\, \gamma \rrbracket = \llbracket u \,|\, \sigma[x_i \mapsto c]_{i\in[n]} \,|\, \gamma \rrbracket$$

283 Using these operations, we define the rewrite rules that allow for spinal duplication. Firstly
284 we have beta reduction ($\leadsto_\beta$), which requires an abstraction and not a phantom-abstraction.

285 $(x\langle x \rangle.t)\, s \leadsto_\beta t\{s/x\}$ $\hspace{8cm}$ (β)

However, its effect is very different: here β-reduction is a linear operation, since the bound variable x occurs exactly once in the body t. Any duplication of the term t in the atomic lambda-calculus proceeds via the sharing reductions, which we define next. The first set of sharing reduction rules move closures towards the outside of a term. Most of these rewrite rules only change the typing derivations in the way that subderivations are composed, with the exception of moving a closure out of scope of a distributor.

$$s[\Gamma]\,t \rightsquigarrow_L (s\,t)[\Gamma] \tag{l_1}$$

$$s\,t[\Gamma] \rightsquigarrow_L (s\,t)[\Gamma] \tag{l_2}$$

$$d\langle\vec{x}\rangle.t[\Gamma] \rightsquigarrow_L (d\langle\vec{x}\rangle.t)[\Gamma] \text{ if } \{\vec{x}\} \cap (t)_{fv} = \{\vec{x}\} \tag{l_3}$$

$$u[x_1,\ldots,x_n \leftarrow t[\Gamma]] \rightsquigarrow_L u[x_1,\ldots,x_n \leftarrow t][\Gamma] \tag{l_4}$$

For the case of lifting a closure outside a distributor, we use a notation $\|\,[\Gamma]\,\|$ to identify the variables captured by a closure, i.e. $\|\,[\vec{x} \leftarrow t]\,\| = \{\vec{x}\}$ and $\|\,[e_1\langle\vec{x_1}\rangle,\ldots,e_n\langle\vec{x_x}\rangle\,|\,c\langle c\rangle\,\overline{[\Gamma]}]\,\| = \{\vec{x_1},\ldots,\vec{x_n}\}$. Then let $\{\vec{z}\} = \|\,[\Gamma]\,\|$ in the following rewrite rule, that can only occur if $\{\vec{x}\} \cap ([\Gamma])_{fv} = \{\}$.

$$\begin{aligned}&u[e_1\langle\vec{w_1}\rangle\ldots e_n\langle\vec{w_n}\rangle\,|\,c\langle\vec{x}\rangle\,\overline{[\Gamma]}[\Gamma]]\\&\rightsquigarrow_L u\{(\vec{w_i}/\vec{z})/e_i\}_{b_{i\in[n]}}[e_1\langle\vec{w_1}/\vec{z}\rangle\ldots e_n\langle\vec{w_n}/\vec{z}\rangle\,|\,c\langle\vec{x}\rangle\,\overline{[\Gamma]}][\Gamma]\end{aligned} \tag{l_5}$$

The proof rewrite rule corresponding with the rewrite rule l_5 can be broken down into two parts. The first part is readjusting how the derivations compose as shown below.

The second part of the rewrite rule justifies the need for the book-keeping operation. In the rewrite below, let A be the type of a variable z where $z \in \vec{z}$. After lifting, we want to remove the variable from the cover as to ensure correctness since the variables in the cover denote the variables captured by the environment. Book-keeping allows us to remove these variables simultaneously.

The lifting rules (l_i) are justified by the need to lift closures out of the distributor, as opposed to duplicating them. The second set of rewrite rules, consecutive sharings are compounded and unary sharings are applied as substitutions.

$$u[w_1, \ldots, w_m \leftarrow y_i][y_1, \ldots, y_n \leftarrow t] \rightsquigarrow_C u[y_1, \ldots, y_{i-1}, w_1, \ldots, w_m, y_{i+1}, \ldots, y_n \leftarrow t] \qquad (c_1)$$

$$u[x \leftarrow t] \rightsquigarrow_C u\{t/x\} \qquad (c_2)$$

The atomic steps for duplicating are given in the third and final set of rewrite rules. The first being the atomic duplication step of an application, which is the same rule used in [12]. The proof rewrite steps for each rule are also provided. For simplicity, we only show the binary case for each rule.

$$u[x_1 \ldots x_n \leftarrow s\,t] \rightsquigarrow_D u\{z_1\,y_1/x_1\} \ldots \{z_n\,y_n/x_n\}[z_1 \ldots z_n \leftarrow s][y_1 \ldots y_n \leftarrow t] \qquad (d_1)$$

$$\cfrac{\cfrac{(A \to B) \wedge A}{B}{}_{@}}{B \wedge B}{}^{\triangle} \qquad \cfrac{\cfrac{(A \to B)}{(A \to B) \wedge (A \to B)}{}^{\triangle} \wedge \cfrac{B}{B \wedge B}{}^{\triangle}}{\cfrac{(A \to B) \wedge A}{B}{}_{@} \wedge \cfrac{(A \to B) \wedge A}{B}{}_{@}}$$

$$u[x_1, \ldots, x_n \leftarrow c\langle\vec{y}\rangle.t] \rightsquigarrow_D$$
$$u\{e_i\langle w_1^i\rangle.w_1^i/x_i\}_{1 \le i \le n}[e_1\langle w_1^1\rangle \ldots e_n\langle w_1^n\rangle \,|\, c\langle\vec{y}\rangle[w_1^1, \ldots, w_1^n \leftarrow t]] \qquad (d_2)$$

$$\cfrac{A \to \boxed{\begin{array}{c} \cfrac{(A \to B) \wedge \Gamma}{B \wedge \Gamma}{}_{s} \\[4pt] \Downarrow \\ C \end{array}}}{(A \to C) \wedge (A \to C)}{}^{\triangle} \qquad \cfrac{A \to \boxed{\begin{array}{c} \cfrac{(A \to B) \wedge \Gamma}{B \wedge \Gamma}{}_{s} \\[4pt] \Downarrow \\ \cfrac{C}{C \wedge C}{}^{\triangle} \end{array}}}{(A \to C) \wedge (A \to C)}{}_{d}$$

$$u[e_1\langle\vec{w_1}\rangle \ldots e_n\langle\vec{w_n}\rangle \,|\, c\langle c\rangle[\vec{w_1}, \ldots, \vec{w_n} \leftarrow c]] \rightsquigarrow_D u\{e_1\langle\vec{w_1}\rangle\}_e \ldots \{e_n\langle\vec{w_n}\rangle\}_e \qquad (d_3)$$

$$\cfrac{\cfrac{A \to \cfrac{A}{A \wedge A}{}^{\triangle}}{}^{\lambda}}{(A \to A) \wedge (A \to A)}{}_{d} \qquad \overline{A \to A}{}^{\lambda} \wedge \overline{A \to A}{}^{\lambda}$$

▶ **Proposition 15.** *If $s \rightsquigarrow_{L,C,D} t$ and $s : C$, then $t : C$*

▶ **Lemma 16** (Sharing reduction preserves denotation)**.** *If $s \rightsquigarrow_{L,D,C} t$ then $[\![\,s\,|\,\sigma\,|\,\gamma\,]\!] = [\![\,t\,|\,\sigma\,|\,\gamma\,]\!]$*

4   Strong Normalisation of Sharing Reductions

In order to show our calculus is strongly normalising, we first show that the sharing reduction rules are strongly normalising. To do this, we make use of an 'intermediate calculus' called the weakening calculus. Following the approaches of [12, 13], we indite a measure on terms based on its connection with the weakening calculus. We show that this measure strictly decreases as sharing reduction progresses.

▶ **Definition 17.** *The w-terms and the weakening calculus ($\Lambda_{\mathcal{W}}$) are*

$$T, U, V \quad ::= \quad x \quad | \quad \lambda x.T^* \quad | \quad U\,V \quad | \quad T[\leftarrow U] \quad | \quad \bullet \qquad\qquad (*) \text{ where } x \in (T)_{fv}$$

The terms are variable, abstraction, application, weakening, and a bullet. In the weakening $T[\leftarrow U]$, the subterm U is *weakened*. The interpretation of atomic terms to weakening terms $[\![\,-\,|\,-\,|\,-\,]\!]_{\mathcal{W}}$ can be seen as an extension of the translation into the λ-calculus (Definition 9)

340 ▶ **Definition 18.** *The interpretation* $[\![-\,|\,-\,|\,-]\!]_\mathcal{w} : \Lambda_a^S \times (V \to \Lambda_\mathcal{w}) \times (V \to V) \to \Lambda_\mathcal{w}$ *with*
341 *maps* $\sigma : V \to \Lambda_\mathcal{w}$ *and* $\gamma : V \to V$ *is defined as an extension of the translation in (Definition*
342 *9) with the following additional special cases.*

$$343 \qquad [\![\,u[\leftarrow t]\,|\,\sigma\,|\,\gamma\,]\!]_\mathcal{w} = [\![\,u\,|\,\sigma\,|\,\gamma\,]\!]_\mathcal{w}[\leftarrow [\![\,t\,|\,\sigma\,|\,\gamma\,]\!]_\mathcal{w}]$$

$$344 \qquad [\![\,u[\,|\,c\langle c\rangle\,\overline{\Gamma}]\,]\,|\,\sigma\,|\,\gamma\,]\!]_\mathcal{w} = [\![\,u\overline{\Gamma}\,|\,\sigma[c \mapsto \bullet]\,|\,\gamma\,]\!]_\mathcal{w}$$

$$345 \qquad [\![\,u[\,|\,c\langle x_1, \ldots, x_n\rangle\,\overline{\Gamma}]\,]\,|\,\sigma\,|\,\gamma\,]\!]_\mathcal{w} = [\![\,u\overline{\Gamma}\,|\,\sigma'\,|\,\gamma\,]\!]_\mathcal{w}$$

$$346 \qquad\qquad\qquad\qquad \textit{where } \sigma'(z) = \begin{cases} \sigma(z)\{\bullet/\gamma(c)\} & z \in \{x_1, \ldots, x_n\} \\ \sigma(z) & \textit{otherwise} \end{cases}$$

347
348

349 We also have translations of the weakening calculus to and from the lambda calculus. Both of
350 these translations have been provided in [12]. The interpretation $\lfloor - \rfloor$ from weakening terms
351 to λ-terms discards all weakenings. The interpretation $(\!|-|\!)^\mathcal{w} : \Lambda \to \Lambda_\mathcal{w}$ is defined below.

352 ▶ **Definition 19.** *The interpretation* $M \in \Lambda$, $(\!|-|\!)^\mathcal{w} : \Lambda \to \Lambda_\mathcal{w}$ *is defined by*

$$353 \qquad (\!|\,x\,|\!)^\mathcal{w} = x$$

$$354 \qquad (\!|\,M\,N\,|\!)^\mathcal{w} = (\!|\,M\,|\!)^\mathcal{w}\,(\!|\,N\,|\!)^\mathcal{w}$$

$$355 \qquad (\!|\,\lambda x.N\,|\!)^\mathcal{w} = \begin{cases} \lambda x.(\!|\,N\,|\!)^\mathcal{w} & \textit{if } x \in (N)_{fv} \\ \lambda x.(\!|\,N\,|\!)^\mathcal{w}[\leftarrow x] & \textit{otherwise} \end{cases}$$
356

357 The following equalities can be observed, where $\sigma^\Lambda(z) = \lfloor \sigma^\mathcal{w}(z) \rfloor$.

358 ▶ **Proposition 20.** *For* $N \in \Lambda$ *and* $t \in \Lambda_a^S$ *the following properties hold*

$$359 \qquad \lfloor [\![\,t\,|\,\sigma^\mathcal{w}\,|\,\gamma\,]\!]_\mathcal{w} \rfloor = [\![\,t\,|\,\sigma^\Lambda\,|\,\gamma\,]\!] \qquad\qquad [\![\,(\!|\,N\,|\!)\,]\!]^\mathcal{w} = (\!|\,N\,|\!)^\mathcal{w} \qquad\qquad \lfloor (\!|\,N\,|\!)^\mathcal{w} \rfloor = N$$

360 Here we can take advantage that preservation of strong normalisation has been proven for
361 this weakening calculus already in [12], providing the proof for Proposition 22. Additionally,
362 similar ideas and results can be found elsewhere, i.e. with memory in [**?**], the λ-I calculus in
363 [**?**], the λ-void calculus [**?**], and the weakening $\lambda\mu$-calculus [13].

364 ▶ **Definition 21.** *In the weakening calculus,* β-*reduction is defined as follows, where* $\overline{\Gamma}$ *are*
365 *weakening constructs.*

$$366 \qquad ((\lambda x.T)\overline{\Gamma})\,U \to_\beta T\{U/x\}\overline{\Gamma} \qquad\qquad\qquad\qquad (\mathcal{w}_\beta)$$

367 ▶ **Proposition 22.** *If* $N \in \Lambda$ *is strongly normalising, then so is* $(\!|\,N\,|\!)^\mathcal{w}$

368 When translating from the spinal atomic λ-calculus to the weakening calculus, weakenings
369 are maintained whilst sharings are interpreted through duplication via substitution. Thus the
370 reduction rules in the weakening calculus cover the spinal reductions for nullary distributors
371 and weakenings.

372 ▶ **Definition 23.** *The weakening reductions* $(\to_\mathcal{w})$ *proceeds as follows.*

$$373 \qquad \lambda x.T[\leftarrow U] \to_\mathcal{w} (\lambda x.T)[\leftarrow U] \quad \textit{if } x \notin (U)_{fv} \qquad\qquad (\mathcal{w}_1)$$
$$374 \qquad U[\leftarrow T]\,V \to_\mathcal{w} (U\,V)[\leftarrow T] \qquad\qquad\qquad\qquad (\mathcal{w}_2)$$
$$375 \qquad U\,V[\leftarrow T] \to_\mathcal{w} (U\,V)[\leftarrow T] \qquad\qquad\qquad\qquad (\mathcal{w}_3)$$

$$T[\leftarrow U[\leftarrow V]] \rightarrow_w T[\leftarrow U][\leftarrow V] \tag{w_4}$$

$$T[\leftarrow \lambda x.U] \rightarrow_w T[\leftarrow U\{\bullet/x\}] \tag{w_5}$$

$$T[\leftarrow U\,V] \rightarrow_w T[\leftarrow U][\leftarrow V] \tag{w_6}$$

$$T[\leftarrow \bullet] \rightarrow_w T \tag{w_7}$$

$$T[\leftarrow U] \rightarrow_w T \quad \textit{if } U \textit{ is a subterm of } T \tag{w_8}$$

It is easy to see that these rules correspond to special cases of the sharing reduction rules for Λ_a^S. Lifting a closure relates (w_1) and (l_3), (w_2) and (l_1), (w_3) and (l_2), (w_4) and (l_4), (w_5) and (d_2), and duplicating a term relates (w_6) and (d_1), and (w_7) and (d_3). It is not so obvious to see what the case (w_8) corresponds to. If U is a subterm of T, then in the corresponding Λ_a^S-term this term would be shared and one of the copies would be in a weakening. Thus this reduction relates to the case (c_1), where we remove the weakening. We demonstrate by considering $t[\leftarrow y][\vec{x} \cdot y \cdot \vec{z} \leftarrow u] \rightsquigarrow_C t[\vec{x} \cdot \vec{z} \leftarrow u]$. On the left hand side, the corresponding weakening-term (obtained by $(\!(-)\!)^w$) would have the weakening $[\leftarrow U]$ where $U = (\!(u)\!)^w$. This is because U is substituted into $[\leftarrow y]$, but on the right hand side this would be gone. This situation can only occur if there are other copies of U substituted into the term. This corresponds to if only the corresponding (c_1) reduction rule can occur. This resemblace is confirmed by the following Lemmas.

▶ **Lemma 24.** *If* $t \rightsquigarrow_\beta u$ *then* $[\![\,t\,]\!]^w \rightarrow_\beta^+ [\![\,u\,]\!]^w$

▶ **Lemma 25.** *If* $t \rightsquigarrow_{(C,D,L)} u$ *and for any* $x \in (t)_{bv} \cup (t)_{fp}$ *and for all* z, $x \notin (\sigma(z))_{fv}$.

$$[\![\,t\,|\,\sigma\,|\,\gamma\,]\!]_w \rightarrow_w^* [\![\,u\,|\,\sigma\,|\,\gamma\,]\!]_w$$

We now define the components that we use for our measure on spinal atomic λ-terms that we will use to prove strong normalisation of sharing reductions. The *height* of a term is intuitively a multiset of integers that record the distance of each sharing. The distance is measured by the number of constructors from the sharing node to the root of the term in its graphical notation. The height is defined on terms as $\mathcal{H}^i(-)$, where i is an integer. We say $\mathcal{H}(t)$ for $\mathcal{H}^1(t)$. We use $\uplus$ to denote the disjoint union of two multisets. We denote $\mathcal{H}^i([\Gamma_1]) \uplus \cdots \uplus \mathcal{H}^i([\Gamma_n])$ as $\mathcal{H}^i(\overline{[\Gamma]})$ for the environment $\overline{[\Gamma]} = [\Gamma_1], \ldots, [\Gamma_n]$.

▶ **Definition 26** (Sharing Height). *The sharing height* $\mathcal{H}^i(t)$ *of a term* t *is given by*

$$\mathcal{H}^i(x) = \{\}$$

$$\mathcal{H}^i(s\,t) = \mathcal{H}^{i+1}(s) \uplus \mathcal{H}^{i+1}(t)$$

$$\mathcal{H}^i(c\langle \vec{x} \rangle.t) = \mathcal{H}^{i+1}(t)$$

$$\mathcal{H}^i(t[\Gamma]) = \mathcal{H}^i(t) \uplus \mathcal{H}^i([\Gamma]) \uplus \{i^1\}$$

$$\mathcal{H}^i([x_1, \ldots, x_n \leftarrow t]) = \mathcal{H}^{i+1}(t)$$

$$\mathcal{H}^i([\overrightarrow{e\langle \vec{w} \rangle}\,|\,c\langle \vec{x} \rangle\,\overline{[\Gamma]}]) = \mathcal{H}^{i+1}(\overline{[\Gamma]}) \uplus \{(i+1)^n\} \textit{ where } n \textit{ is the number of closures in } \overline{[\Gamma]}$$

This measure then strictly decreases for the rewrite rules l_1, l_2, l_3, l_4 and l_5.

▶ **Lemma 27.** *If* $t \rightsquigarrow_{(L)} u$ *then* $\mathcal{H}^i(t) > \mathcal{H}^i(u)$

The other measure we consider is the *weight* of a term. Intuitively this quantifies the remaining duplications, which are performed with $\rightsquigarrow_D$ reductions. Calculating the weight of a term requires an auxiliary function from variables to integers. This function is defined by assigning integer weights to the variables of a term. This auxiliary function is defined on

terms $\mathcal{V}^i(-)$, where i is an integer. To measure variables independently of binders is vital. It allows to measure distributors, which duplicate λ's but not the bound variable. Also, only bound variables for abstractions are measured since variables bound by sharings are substituted in the interpretation.

▶ **Definition 28** (Variable Weights). *The function $\mathcal{V}^i(t)$ returns a function that assigns integer weights to the free variables of t. It is defined by the following*

$$\mathcal{V}^i(x) = \{x \mapsto i\}$$

$$\mathcal{V}^i(s\,t) = \mathcal{V}^i(s) \cup \mathcal{V}^i(t)$$

$$\mathcal{V}^i(c\langle c \rangle.t) = \mathcal{V}^i(t)/\{c\}$$

$$\mathcal{V}^i(c\langle \vec{x} \rangle.t) = \mathcal{V}^i(t) \cup \{c \mapsto i\}$$

$$\mathcal{V}^i(t[\leftarrow s]) = \mathcal{V}^i(t) \cup \mathcal{V}^1(s)$$

$$\mathcal{V}^i(t[x_1,\ldots,x_n \leftarrow s]) = \mathcal{V}^i(t)/\{x_1,\ldots,x_n\} \cup \mathcal{V}^{f(x_1)+\cdots+f(x_n)}(s) \; where \; f = \mathcal{V}^i(t)$$

$$\mathcal{V}^i(t[e_1\langle \vec{w_1} \rangle \ldots e_n\langle \vec{w_n} \rangle | c\langle c \rangle \overline{[\Gamma]}]) = \mathcal{V}^i(t\overline{[\Gamma]})/\{c,e_1,\ldots,e_n\}$$

$$\mathcal{V}^i(t[e_1\langle \vec{w_1} \rangle \ldots e_n\langle \vec{w_n} \rangle | c\langle \vec{x} \rangle \overline{[\Gamma]}]) = \mathcal{V}^i(t\overline{[\Gamma]})/\{e_1,\ldots,e_n\} \cup \{c \mapsto i\}$$

The weight of a term can then be defined via the use of this auxiliary function. The auxiliary function is used when calculating the weight of a sharing, where the sharing weight of the variables bound by the sharing play a significant role in calculating the weight of the shared term. In the case of a weakening, we assign an initial weight of 1 to indicate that the constructor is not duplicated by appears at least once in the weakening calculus. Again we say $\mathcal{W}(t) = \mathcal{W}^1(t)$.

▶ **Definition 29** (Sharing Weight). *The sharing weight $\mathcal{W}^i(t)$ of a term t is a multiset of integers computed by the function defined below*

$$\mathcal{W}^i(x) = \{\}$$

$$\mathcal{W}^i(s\,t) = \mathcal{W}^i(s) \cup \mathcal{W}^i(t) \cup \{i\}$$

$$\mathcal{W}^i(c\langle c \rangle.t) = \mathcal{W}^i(t) \cup \{i\} \cup \{\mathcal{V}^i(t)(c)\}$$

$$\mathcal{W}^i(c\langle \vec{x} \rangle.t) = \mathcal{W}^i(t) \cup \{i\}$$

$$\mathcal{W}^i(t[\leftarrow s]) = \mathcal{W}^i(t) \cup \mathcal{W}^1(s)$$

$$\mathcal{W}^i(t[x_1,\ldots,x_n \leftarrow s]) = \mathcal{W}^i(t) \cup \mathcal{W}^{f(x_1)+\cdots+f(x_n)}(s) \; where \; f = \mathcal{V}^i(t)$$

$$\mathcal{W}^i(t[e_1\langle \vec{w_1} \rangle \ldots e_n\langle \vec{w_n} \rangle | c\langle c \rangle \overline{[\Gamma]}]) = \mathcal{W}^i(t\overline{[\Gamma]}) \cup \{\mathcal{V}^i(t\overline{[\Gamma]})(c)\}$$

$$\mathcal{W}^i(t[e_1\langle \vec{w_1} \rangle \ldots e_n\langle \vec{w_n} \rangle | c\langle \vec{x} \rangle \overline{[\Gamma]}]) = \mathcal{W}^i(t\overline{[\Gamma]})$$

We show that this measure then strictly decreases on the rewrite rules d_1, d_2, d_3 and is unaffected by all the other sharing reduction rules.

▶ **Lemma 30.** *If $t \rightsquigarrow_D u$ then $\mathcal{W}^i(t) > \mathcal{W}^i(u)$*

▶ **Lemma 31.** *If $t \rightsquigarrow_{(L,C)} u$ then $\mathcal{W}^i(t) = \mathcal{W}^i(u)$*

The last measure we consider is the number of closures in the term, where is can be easily observed that the rewrite rules c_1 and c_2 strictly decrease this measure, and that the $\rightsquigarrow_L$ rules do not alter the number of closures. We then use this along with height and weight to define a *sharing measure* on terms.

▶ **Definition 32.** *The* sharing measure *of a Λ_a^S-term t is a triple $(\mathcal{W}(t), C, \mathcal{H}(t))$ where C is the number of closures in t. We can compare two different sharing measures by considering the lexicographical preferences according to weight > number of closures > height.*

▶ **Theorem 33.** *Sharing reduction $\leadsto_{(D,L,C)}$ is strongly normalising*

Proof. From Lemma 30, Lemma 31, and Lemma 27, it follows that the sharing measure of a term is strictly decreasing under $\leadsto_{(D,L,C)}$, proving the statement. ◀

Now that we have proven the sharing reductions are strongly normalising, we can prove that they are confluent for closed terms.

▶ **Theorem 34.** *The sharing reduction relation $\leadsto_{(D,L,C)}$ is confluent*

Proof. Lemma 16 tells us that the preservation is preserved under reduction i.e. for $s \leadsto_{(R,D,L,C)} t$, $[\![s]\!] = [\![t]\!]$. Therefore given $t \leadsto_{(D,L,C)}^* s_1$ and $t \leadsto_{(D,L,C)}^* s_2$, $[\![t]\!] = [\![s_1]\!] = [\![s_2]\!]$. Since we know that sharing reductions are strongly normalising, we know there exists terms u_1 and u_2 in sharing normal form such that $s_1 \leadsto_{(D,L,C)}^* u_1$ and $s_2 \leadsto_{(D,L,C)}^* u_2$. Lemma 11 tells us that terms in closed terms in sharing normal form are in correspondence with their denotations i.e. $(\![[\![t]\!]]\!)' = t$. Since by Lemma 16 we know $[\![u_1]\!] = [\![s_1]\!] = [\![s_2]\!] = [\![u_2]\!]$, and by Lemma 11 $(\![[\![u_1]\!]]\!)' = u_1$ and $(\![[\![u_2]\!]]\!)' = u_2$, we can conclude $u_1 = u_2$. Hence, we prove confluence. ◀

5 Preservation of Strong Normalisation

Here we show how Λ_a^S preserves strong normalisation with respect to the λ-calculus. Recall that by Proposition 20 that for all $N \in \Lambda$, $[\![(\![N]\!)]\!]^{\mathcal{W}} = (\![N]\!)^{\mathcal{W}}$, and that Proposition 22 states if a term $N \in \Lambda$ is strongly normalising then so is $(\![N]\!)^{\mathcal{W}}$. Observe that the statement 'if term M has an infinite reduction sequence then term N has an infinite reduction sequence' is equivalent to 'if term N is strongly normalising then term M is strongly normalising' by contraposition. Therefore, given a strongly normalising term $N \in \Lambda$, we know that its corresponding weakening term is also strongly normalising. Furthermore, since $[\![(\![N]\!)]\!]^{\mathcal{W}} = (\![N]\!)^{\mathcal{W}}$, we know that $[\![(\![N]\!)]\!]^{\mathcal{W}}$ is also strongly normalising.
We prove that the spinal atomic λ-calculus preserves strong normalisation with the following.

▶ **Lemma 35.** *For $t \in \Lambda_a^S$ has an infinite reduction path, then $[\![t]\!]^{\mathcal{W}}$ also has an infinite reduction path.*

Proof. Due to Theorem 34, we know that the infinite reduction path contains an infinite β-reduction. This means in the reduction sequence, between each β-reduction, there are finite many $\leadsto_{(D,L,C)}$ reduction steps. Lemma 25 says each $\leadsto_{(D,L,C)}$ step in Λ_a^S corresponds

to zero or more weakening reductions ($\rightsquigarrow_\mathcal{w}^*$). Lemma 24 says that each beta reduction in Λ_a^S corresponds to one or more β-steps in $\Lambda_\mathcal{w}$. Therefore, it is inevitable that $[\![\, t \,]\!]^\mathcal{w}$ also has an infinite reduction path. ◀

▶ **Theorem 36.** *If $N \in \Lambda$ is strongly normalising, then so is $(\!|\, N \,|\!)$.*

Proof. For a given $N \in \Lambda$ that is strongly normalising, we know by Lemma 22 that $(\!|\, N \,|\!)^\mathcal{w}$ is strongly normalising. Then $[\![\, (\!|\, N \,|\!) \,]\!]^\mathcal{w}$ is strongly normalising, since Proposition 20 states that $(\!|\, N \,|\!)^\mathcal{w} = [\![\, (\!|\, N \,|\!) \,]\!]^\mathcal{w}$. Then by Lemma 35, which states that if $[\![\, t \,]\!]^\mathcal{w}$ is strongly normalising, then t is strongly normalising, proves that $(\!|\, N \,|\!)$ is strongly normalising. ◀

A The Spinal Atomic λ-Calculus

A.1 Compilation and Readback

In this section we provide the proof for Proposition 11: For $s, t \in \Lambda_a^S$, if $s \sim t$ then $[\![\,s\,]\!] = [\![\,t\,]\!]$.

Proof. Let us consider the cases.

$t[\Gamma_1][\Gamma_2] \sim t[\Gamma_2][\Gamma_1]$
Consider $[\![\,t[\Gamma_1][\Gamma_2]\,|\,\sigma\,|\,\gamma\,]\!] = [\![\,t[\Gamma_1]\,|\,\sigma'\,|\,\gamma'\,]\!] = [\![\,t\,|\,\sigma''\,|\,\gamma''\,]\!]$. Since due to conditions any variable $x \in \|\,[\Gamma_2]\,\|$ cannot occur in $[\Gamma_1]$, for all subterms s located in $[\Gamma_1]$, $[\![\,s\,|\,\sigma'\,|\,\gamma'\,]\!] = [\![\,s\,|\,\sigma\,|\,\gamma\,]\!]$. Therefore $[\![\,t\,|\,\sigma''\,|\,\gamma''\,]\!] = [\![\,t[\Gamma_2]\,|\,\sigma'''\,|\,\gamma'''\,]\!] = [\![\,t[\Gamma_2][\Gamma_1]\,|\,\sigma\,|\,\gamma\,]\!]$.

The remaining cases discuss permutations of variables in sharings and phantom-abstractions. In both these cases, we overwrite σ for the cases of the variables in said sharing or phantom-abstractions. The order in which they appear do not influence the translation since we do this for all variables regardless. ◀

We also provide the proof for Lemma 11: For a closed $t \in \Lambda_a^S$, where t has no distributor constructs and only variables are shared, and a closed $N \in \Lambda$. the following

$$[\![\,(\!|\,N\,|\!)'\,]\!] = N \qquad (\!|\,[\![\,t\,]\!]\,|\!)' = t \qquad \exists_{M \in \Lambda}.t = (\!|\,M\,|\!)'$$

Proof. We prove $[\![\,(\!|\,N\,|\!)'\,]\!] = N$ by induction on N

Base Case: Variable
$[\![\,(\!|\,x\,|\!)'\,]\!] = [\![\,x\,]\!] = x$

Inductive Case: Application
$[\![\,(\!|\,M\,N\,|\!)'\,]\!] = [\![\,(\!|\,M\,|\!)'\,]\!]\,[\![\,(\!|\,N\,|\!)'\,]\!] = M\,N$

Inductive Case: Abstraction
$[\![\,(\!|\,\lambda x.M\,|\!)'\,]\!]$
    Case: $|M|_x = 1$
    $= \lambda x.[\![\,(\!|\,M\,|\!)'\,]\!] = \lambda x.M$

    Case: $|M|_x = n$
    $= \lambda x.[\![\,(\!|\,M\frac{n}{x}\,|\!)'[x_1,\dots,x_n \leftarrow x]\,]\!] = \lambda x.[\![\,(\!|\,M\frac{n}{x}\,|\!)'\,|\,\sigma\,|\,I\,]\!] = \lambda x.[\![\,(\!|\,M\frac{n}{x}\,|\!)'\,]\!]\{x/x_i\}_{1 \le i \le n}$
    $\overset{\text{I.H.}}{=} \lambda x.M\frac{n}{x}\{x/x_i\}_{1 \le i \le n} = \lambda x.M$

We prove $(\!|\,[\![\,t\,]\!]\,|\!)' = t$ by induction on t

Base Case: Variable
$(\!|\,[\![\,x\,]\!]\,|\!)' = (\!|\,x\,|\!)' = x$

Inductive Case: Application
$(\!|\,[\![\,s\,t\,]\!]\,|\!)' = (\!|\,[\![\,s\,]\!]\,|\!)'\,(\!|\,[\![\,t\,]\!]\,|\!)' \overset{\text{I.H.}}{=} s\,t$

Inductive Case: Abstraction

612   Case: $(\!|\,[\![\,x\langle x\rangle.t\,]\!]\,|\!)' = x\langle x\rangle.(\!|\,[\![\,t\,]\!]\,|\!)' \overset{\text{I.H.}}{=} x\langle x\rangle.t$

613

614   Case: $(\!|\,[\![\,x\langle x\rangle.t[x_1,\ldots,x_n \leftarrow x]\,]\!]\,|\!)' = (\!|\,\lambda x.[\![\,t\,|\,\sigma\,|\,I\,]\!]\,|\!)'$

615      $= (\!|\,\lambda x.[\![\,t\,]\!]\{x/x_i\}_{1\le i\le n}\,|\!)' = x\langle x\rangle.(\!|\,[\![\,t\,]\!]\,|\!)'[x_1,\ldots,x_n \leftarrow x]$

616      $\overset{\text{I.H.}}{=} x\langle x\rangle.t[x_1,\ldots,x_n \leftarrow x]$

617

618   The proof for $\exists_{M\in\Lambda}.t = (\!|\,M\,|\!)'$ is the same as in [12].   ◀

619   **A.2   Rewrite Rules**

620   In this section we provide the proof for Proposition 37: Given $M \in \Lambda$ such that for all $v \in V$,

621   $\gamma(v) \notin (M)_{fv}$ and $\sigma(x) = x$, the translation $[\![\,u\,|\,\sigma\,|\,\gamma\,]\!]$ commutes with substitution $\{M/x\}$ in

622   the following way

$$[\![\,u\{t/x\}\,|\,\sigma\,|\,\gamma\,]\!] = [\![\,u\,|\,\sigma[x \mapsto [\![\,t\,|\,\sigma\,|\,\gamma\,]\!]]\,|\,\gamma\,]\!]$$

623   **Proof.** We prove this by induction on u

624

625   Base Case: Variable

626   $[\![\,x\{t/x\}\,|\,\sigma\,|\,\gamma\,]\!] = [\![\,t\,|\,\sigma\,|\,\gamma\,]\!] = [\![\,x\,|\,\sigma'\,|\,\gamma\,]\!]$

627

628   $[\![\,y\,|\,\sigma\,|\,\gamma\,]\!] = \sigma(y) = \sigma'(y) = [\![\,y\,|\,\sigma'\,|\,\gamma\,]\!]$

629

630   Inductive Case: Application

631   $[\![\,u\,s\{t/x\}\,|\,\sigma\,|\,\gamma\,]\!] = [\![\,u\{t/x\}\,|\,\sigma\,|\,\gamma\,]\!]\,[\![\,s\{t/x\}\,|\,\sigma\,|\,\gamma\,]\!] \overset{\text{I.H.}}{=} [\![\,u\,|\,\sigma'\,|\,\gamma\,]\!]\,[\![\,s\,|\,\sigma'\,|\,\gamma\,]\!] = [\![\,u\,s\,|\,\sigma'\,|\,\gamma\,]\!]$

632

633   Inductive Case: Abstraction

634   $[\![\,(c\langle c\rangle.s)\{t/x\}\,|\,\sigma\,|\,\gamma\,]\!] = \lambda c.[\![\,s\{t/x\}\,|\,\sigma\,|\,\gamma\,]\!] \overset{\text{I.H.}}{=} \lambda c.[\![\,s\,|\,\sigma'\,|\,\gamma\,]\!] = [\![\,c\langle c\rangle.s\,|\,\sigma'\,|\,\gamma\,]\!]$

635

636   Inductive Case: Phantom-Abstraction

637   $[\![\,(c\langle x_1,\ldots,x_n\rangle.s)\{t/x\}\,|\,\sigma\,|\,\gamma\,]\!]$

638   Case: $x \in \{x_1,\ldots,x_n\}$

639      $= [\![\,(c\langle x_1,\ldots,x_n,x\rangle.s)\{t/x\}\,|\,\sigma\,|\,\gamma\,]\!] = [\![\,c\langle x_1,\ldots,x_n,y_1,\ldots,y_m\rangle.s\{t/x\}\,|\,\sigma\,|\,\gamma\,]\!]$

640   where $\{y_1,\ldots,y_m\} = (t)_{fv}$

641      $= \lambda c.[\![\,s\{t/x\}\,|\,\sigma''\,|\,\gamma\,]\!] \overset{\text{I.H.}}{=} \lambda c.[\![\,s\,|\,\sigma'''_1\,|\,\gamma\,]\!] = \lambda c.[\![\,s\,|\,\sigma'''_2\,|\,\gamma\,]\!] = [\![\,c\langle x_1,\ldots,x_n,x\rangle.s\,|\,\sigma'\,|\,\gamma\,]\!]$

642   where $\sigma''(z) = \begin{cases} \sigma(z)\{c/\gamma(c)\} & \text{if } z \in \{x_1,\ldots,x_n,y_1,\ldots,y_m\} \\ \sigma(z) & \text{otherwise} \end{cases}$

643      $\sigma'''_1 = \sigma''[x \mapsto [\![\,t\,|\,\sigma''\,|\,\gamma\,]\!]]$

644      $\sigma'''_2(z) = \begin{cases} [\![\,t\,|\,\sigma''\,|\,\gamma\,]\!]\{c/\gamma(c)\} & z = x \\ \sigma(z)\{c/\gamma(c)\} & z \in \{x_1,\ldots,x_n\} \\ \sigma(z) & \text{otherwise} \end{cases}$

645

646   Case: $x \notin \{x_1,\ldots,x_n\}$

647      $= [\![\,c\langle x_1,\ldots,x_n\rangle.s\{t/x\}\,|\,\sigma\,|\,\gamma\,]\!] = \lambda c.[\![\,s\{t/x\}\,|\,\sigma''\,|\,\gamma\,]\!] \overset{\text{I.H.}}{=} \lambda c.[\![\,t\,|\,\sigma''[x \mapsto [\![\,t\,|\,\sigma''\,|\,\gamma\,]\!]]\,|\,\gamma\,]\!] =$

648   $\lambda c.[\![\,t\,|\,\sigma''[x \mapsto [\![\,t\,|\,\sigma\,|\,\gamma\,]\!]]\,|\,\gamma\,]\!] = [\![\,c\langle x_1,\ldots,x_n\rangle.s\,|\,\sigma[x \mapsto [\![\,t\,|\,\sigma\,|\,\gamma\,]\!]]\,|\,\gamma\,]\!]$

649   where

650      $\sigma'' = \sigma[x_i \mapsto \sigma(x_i)\{c/\gamma(c)\}]_{i\in[n]}$

651

652   Inductive Case: Sharing

653 $\llbracket u[z_1,\ldots,z_n \leftarrow s]\{t/x\}\,|\,\sigma\,|\,\gamma\,\rrbracket = \llbracket u\{t/x\}[z_1,\ldots,z_n \leftarrow s\{t/x\}]\,|\,\sigma\,|\,\gamma\,\rrbracket = \llbracket u\{t/x\}\,|\,\sigma''\,|\,\gamma\,\rrbracket$

654 $\overset{\text{I.H.}}{=} \llbracket u\,|\,\sigma'''\,|\,\gamma\,\rrbracket = \llbracket u[z_1,\ldots,z_n \leftarrow s]\,|\,\sigma'\,|\,\gamma\,\rrbracket$

655 where

656 $\sigma'' = \sigma[z_1 \mapsto \llbracket s\{t/x\}\,|\,\sigma\,|\,\gamma\,\rrbracket,\ldots,z_n \mapsto \llbracket s\{t/x\}\,|\,\sigma\,|\,\gamma\,\rrbracket]$

657 $\sigma''' = \sigma'[z_1 \mapsto \llbracket s\,|\,\sigma'\,|\,\gamma\,\rrbracket,\ldots,z_n \mapsto \llbracket s\,|\,\sigma'\,|\,\gamma\,\rrbracket]$

658

659 Inductive Case: Distributor 1

660 $\llbracket u[e_1\langle \vec{w_1}\rangle,\ldots,e_n\langle \vec{w_n}\rangle\,|\,c\langle c\rangle\overline{[\Gamma]}]\{t/x\}\,|\,\sigma\,|\,\gamma\,\rrbracket$

661 $= \llbracket u\overline{[\Gamma]}\{t/x\}\,|\,\sigma\,|\,\gamma'\,\rrbracket \overset{\text{I.H.}}{=} \llbracket u\overline{[\Gamma]}\,|\,\sigma'\,|\,\gamma'\,\rrbracket$

662 $= \llbracket u[e_1\langle \vec{w_1}\rangle,\ldots,e_n\langle \vec{w_n}\rangle\,|\,c\langle \vec{x}\rangle\overline{[\Gamma]}]\,|\,\sigma'\,|\,\gamma\,\rrbracket$

663 where

664 $\gamma' = \gamma[e_1 \mapsto c,\ldots,e_n \mapsto c]$

665

666 Inductive Case: Distributor 2

667 $\llbracket u[e_1\langle \vec{w_1}\rangle,\ldots,e_n\langle \vec{w_n}\rangle\,|\,c\langle \vec{x}\rangle\overline{[\Gamma]}]\{t/x\}\,|\,\sigma\,|\,\gamma\,\rrbracket$

668 $= \llbracket u\overline{[\Gamma]}\{t/x\}\,|\,\sigma''\,|\,\gamma'\,\rrbracket \overset{\text{I.H.}}{=} \llbracket u\overline{[\Gamma]}\,|\,\sigma'''\,|\,\gamma'\,\rrbracket$

669 $= \llbracket u[e_1\langle \vec{w_1}\rangle,\ldots,e_n\langle \vec{w_n}\rangle\,|\,c\langle \vec{x}\rangle\overline{[\Gamma]}]\,|\,\sigma'\,|\,\gamma\,\rrbracket$

670 where

671 $\gamma' = \gamma[e_1 \mapsto c,\ldots,e_n \mapsto c]$ ◀

672 The proof for Proposition 13 (repeated here) is shown below. Book-keeping commutes

673 with the translation in the following way

674 if $c\langle y_1,\ldots,y_m\rangle. \in (u)_{fc}$ such that $\{x_1,\ldots,x_n\} \subset \{y_1,\ldots,y_m\}$

675 and for those $z \in \{y_1,\ldots,y_m\}/\{x_1,\ldots,x_n\}$, $\gamma(c) \notin (\sigma(z))_{fv}$

676 or if simply $\{x_1,\ldots,x_n\} \cap (u)_{fv} = \{\}$

$$\llbracket u\{x_1,\ldots,x_n/c\}_b\,|\,\sigma\,|\,\gamma\,\rrbracket = \llbracket u\,|\,\sigma\,|\,\gamma\,\rrbracket$$

677 **Proof.** We prove this by induction on u

678

679 Base Case: Variable

680 $\llbracket x\{x_1,\ldots,x_n/c\}_b\,|\,\sigma\,|\,\gamma\,\rrbracket = \llbracket x\,|\,\sigma\,|\,\gamma\,\rrbracket = \sigma(x) = \sigma'(x) = \llbracket x\,|\,\sigma'\,|\,\gamma'\,\rrbracket$

681 Since is cannot be that $x \in \{x_1,\ldots,x_n\}$

682

683 Base Case: Phantom-Abstraction

684 $\llbracket (c\langle y_1,\ldots,y_m\rangle.t)\{x_1,\ldots,x_n/c\}_b\,|\,\sigma\,|\,\gamma\,\rrbracket = \llbracket c\langle x_1,\ldots,x_n\rangle.t\,|\,\sigma\,|\,\gamma\,\rrbracket$

685 $= \lambda c.\llbracket t\,|\,\sigma''\,|\,\gamma\,\rrbracket = \lambda c.\llbracket t\,|\,\sigma''\,|\,\gamma'\,\rrbracket = \llbracket c\langle y_1,\ldots,y_m\rangle.t\,|\,\sigma'\,|\,\gamma'\,\rrbracket$

686 where

687 $\sigma = \sigma_1[x_1 \mapsto M_1,\ldots,x_n \mapsto M_n]$

688 $\sigma'' = \sigma_1[x_1 \mapsto M_1\{c/d\},\ldots,x_n \mapsto M_n\{c/d\}]$

689 $\gamma(c) = d$

690 Note: due to condition of Proposition any $\{y_i \mapsto M_i\{c/d\}\} = \{y_i \mapsto M_i\}$

691

692 Base Case: Distributor

693 $\llbracket u[e_1\langle \vec{w_1}\rangle,\ldots,e_n\langle \vec{w_n}\rangle\,|\,c\langle y_1,\ldots,y_m\rangle\overline{[\Gamma]}]\{x_1,\ldots,x_n/c\}_b\,|\,\sigma\,|\,\gamma\,\rrbracket$

694 $= \llbracket u[e_1\langle \vec{w_1}\rangle,\ldots,e_n\langle \vec{w_n}\rangle\,|\,c\langle x_1,\ldots,x_n\rangle\overline{[\Gamma]}]\,|\,\sigma\,|\,\gamma\,\rrbracket = \llbracket u\overline{[\Gamma]}\,|\,\sigma'\,|\,\gamma'\,\rrbracket$

695 $= \llbracket u[e_1\langle \vec{w_1}\rangle,\ldots,e_n\langle \vec{w_n}\rangle\,|\,c\langle y_1,\ldots,y_m\rangle\overline{[\Gamma]}]\,|\,\sigma\,|\,\gamma\,\rrbracket$

696 where $\gamma' = \gamma[e_1 \mapsto c,\ldots,e_n \mapsto c]$

697 $\sigma = \sigma_1[x_1 \mapsto M_1,\ldots,x_n \mapsto M_n]$

$\sigma' = \sigma_1[x_1 \mapsto M_1\{c/\gamma(c)\}, \ldots, x_n \mapsto M_n\{c/\gamma(c)\}]$

Inductive Case: Application

$\llbracket (s\,t)\{x_1, \ldots, x_n/c\}_b \,|\, \sigma \,|\, \gamma \rrbracket = \llbracket s\{x_1, \ldots, x_n/c\}_b \,|\, \sigma \,|\, \gamma \rrbracket \, \llbracket t\{x_1, \ldots, x_n/c\}_b \,|\, \sigma \,|\, \gamma \rrbracket$

$\overset{\text{I.H.}}{=} \llbracket s \,|\, \sigma \,|\, \gamma \rrbracket \, \llbracket t \,|\, \sigma \,|\, \gamma \rrbracket = \llbracket s\,t \,|\, \sigma \,|\, \gamma \rrbracket$

Inductive Case: Abstraction

$\llbracket (z\langle z \rangle.t)\{x_1, \ldots, x_n/c\}_b \,|\, \sigma \,|\, \gamma \rrbracket = \lambda z.\llbracket t\{x_1, \ldots, x_n/c\}_b \,|\, \sigma \,|\, \gamma \rrbracket \overset{\text{I.H.}}{=} \lambda z.\llbracket t \,|\, \sigma \,|\, \gamma \rrbracket = \llbracket z\langle z \rangle.t \,|\, \sigma \,|\, \gamma \rrbracket$

Inductive Case: Phantom-Abstraction

$\llbracket (d\langle z_1, \ldots, z_m \rangle.t)\{x_1, \ldots, x_n/c\}_b \,|\, \sigma \,|\, \gamma \rrbracket = \lambda d.\llbracket t\{x_1, \ldots, x_n/c\}_b \,|\, \sigma' \,|\, \gamma \rrbracket$

$\overset{\text{I.H.}}{=} \lambda d.\llbracket t \,|\, \sigma' \,|\, \gamma \rrbracket = \llbracket d\langle z_1, \ldots, z_m \rangle.t \,|\, \sigma \,|\, \gamma \rrbracket$

Inductive Case: Sharing

$\llbracket u[z_1, \ldots, z_m \leftarrow t]\{x_1, \ldots, x_n/c\}_b \,|\, \sigma \,|\, \gamma \rrbracket$

$= \llbracket u\{x_1, \ldots, x_n/c\}_b[z_1, \ldots, z_m \leftarrow t\{x_1, \ldots, x_n/c\}_b] \,|\, \sigma \,|\, \gamma \rrbracket$

$= \llbracket u\{x_1, \ldots, x_n/c\}_b \,|\, \sigma' \,|\, \gamma \rrbracket \overset{\text{I.H.}}{=} \llbracket u \,|\, \sigma'' \,|\, \gamma \rrbracket = \llbracket u[z_1, \ldots, z_m \leftarrow t] \,|\, \sigma \,|\, \gamma \rrbracket$

Inductive Case: Distributor

$\llbracket u[e_1\langle \vec{w_1} \rangle, \ldots, e_m\langle \vec{w_m} \rangle \,|\, d\langle d \rangle \overline{[\Gamma]}]\{x_1, \ldots, x_n/c\}_b \,|\, \sigma \,|\, \gamma \rrbracket$

$= \llbracket u[\underline{e_1\langle \vec{w_1} \rangle, \ldots, e_m\langle \vec{w_m} \rangle \,|\, d\langle d \rangle \overline{[\Gamma]}}\{x_1, \ldots, x_n/c\}_b] \,|\, \sigma \,|\, \gamma \rrbracket$

$= \llbracket u\overline{[\Gamma]}\{x_1, \ldots, x_n/c\}_b \,|\, \sigma \,|\, \gamma' \rrbracket \overset{\text{I.H.}}{=} \llbracket u\overline{[\Gamma]} \,|\, \sigma \,|\, \gamma' \rrbracket$

$= \llbracket u[e_1\langle \vec{w_1} \rangle, \ldots, e_m\langle \vec{w_m} \rangle \,|\, d\langle d \rangle \overline{[\Gamma]}] \,|\, \sigma \,|\, \gamma \rrbracket \qquad\qquad\qquad\qquad\qquad \blacktriangleleft$

The proof for 14 (repeated here) is below. Exorcisms commute with the translation in the following way

if $c\langle x_1, \ldots, x_n \rangle. \in (u)_{fc}$ or $\{x_1, \ldots, x_n\} \cap (u)_{fv} = \{\}$

$$\llbracket u\{c\langle x_1, \ldots, x_n \rangle\}_e \,|\, \sigma \,|\, \gamma \rrbracket = \llbracket u \,|\, \sigma[x_i \mapsto c]_{i\in[n]} \,|\, \gamma \rrbracket$$

Proof. We prove this by induction on u

Base Case: Variable

$\llbracket z\{c\langle x_1, \ldots, x_n \rangle\}_e \,|\, \sigma \,|\, \gamma \rrbracket = \llbracket z \,|\, \sigma \,|\, \gamma \rrbracket = \sigma(z) = \sigma'(z) = \llbracket z \,|\, \sigma' \,|\, \gamma \rrbracket$

Base Case: Phantom-Abstraction

$\llbracket (c\langle x_1, \ldots, x_n \rangle.t)\{c\langle x_1, \ldots, x_n \rangle\}_e \,|\, \sigma \,|\, \gamma \rrbracket = \llbracket c\langle c \rangle.t[x_1, \ldots, x_n \leftarrow c] \,|\, \sigma \,|\, \gamma \rrbracket$

B   Strong Normalisation of Sharing Reductions

The weakening calculus is used to show preservation of strong normalisation with respect to the λ-calculus. A β-step in our calculus may occur within a weakening, and therefore is simulated by zero β-steps in the λ-calculus. Therefore if there is an infinite reduction path located inside a weakening in Λ_a^S, then the reduction path is not preserved in the corresponding λ-term as there are no weakenings. To deal with this, just as done in [**?**, 12, 13], we make use of the weakening calculus. A β-step is non-deleteing precisely because of the weakening construct. If a β-step would be deleting in the λ-calculus, then the weakening calculus would instead keep the deleted term around as 'garbage', which can continue to reduce unless explicitly 'garbage-collected' by extra (non-β) reduction steps. The weakening calculus has already been shown to preserve strong normalisation through the use of a perpetual strategy in [12]. A part of proving PSN is then using the weakening calculus to prove that if $t \in \Lambda_a^S$ has a infinite reduction path, then its translation into the weakening calculus also has an infinite reduction path.

First we demonstrate that our readback translation (Definition 18) is truly an extention of the translation into the λ-calculus (Definition 9). We therefore demonstrate that our operations (substitution, book-keeping, and exorcisms) commute with the two translation functions in the same way.

▶ **Proposition 37.** *Given $M \in \Lambda$ such that for all $v \in V$, $\gamma(v) \notin (M)_{fv}$ and $\sigma(x) = x$, the translation $[\![u|\sigma|\gamma]\!]_w$ commutes with substitution $\{M/x\}$ in the following way*

$$[\![u\{t/x\}|\sigma|\gamma]\!]_w = [\![u|\sigma[x \mapsto [\![t|\sigma|\gamma]\!]_w]|\gamma]\!]_w$$

Proof. We prove this by induction on u. The argument is similar to the proof of Proposition 37. We only discuss here to cases involving the three special cases defined in Definition 18.

Inductive Case: Weakening

$[\![u[\leftarrow s]\{t/x\}|\sigma|\gamma]\!]_w = [\![u\{t/x\}|\sigma|\gamma]\!]_w[\leftarrow [\![s\{t/x\}|\sigma|\gamma]\!]_w]$

983

$$\begin{array}{ccc}
\Lambda_a^S \xrightarrow{\llbracket - | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}}} \Lambda_{\mathcal{W}} & \Lambda_a^S \xrightarrow{\llbracket - \rrbracket^{\mathcal{W}}} \Lambda_{\mathcal{W}} & \Lambda_{\mathcal{W}} \\
\llbracket - | \sigma^\Lambda | \gamma \rrbracket \quad \lfloor - \rfloor & (\!|-|\!) \quad (\!|-|\!)^{\mathcal{W}} & (\!|-|\!)^{\mathcal{W}} \quad \lfloor - \rfloor \\
\Lambda & \Lambda & \Lambda \xrightarrow{=} \Lambda \\
\lfloor \llbracket t | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor = \llbracket t | \sigma^\Lambda | \gamma \rrbracket & \llbracket (\!|N|\!) \rrbracket^{\mathcal{W}} = (\!|N|\!)^{\mathcal{W}} & \lfloor (\!|N|\!)^{\mathcal{W}} \rfloor = N
\end{array}$$

984 where $\sigma^\Lambda(z) = \lfloor \sigma^{\mathcal{W}}(z) \rfloor$.

985 **Proof.** We prove $\lfloor \llbracket u | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor = \llbracket u | \sigma^\Lambda | \gamma \rrbracket$ by induction on u.

986

987 Base Case: Variable

988 $\lfloor \llbracket x | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor = \lfloor \sigma^{\mathcal{W}}(x) \rfloor = \llbracket x | \sigma^\Lambda | \gamma \rrbracket$

989

990 Inductive Case: Application

991 $\lfloor \llbracket s\,t | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor = \lfloor \llbracket s | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor \lfloor \llbracket t | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor \overset{\text{I.H.}}{=} \llbracket s | \sigma^\Lambda | \gamma \rrbracket \llbracket t | \sigma^\Lambda | \gamma \rrbracket = \llbracket s\,t | \sigma^\Lambda | \gamma \rrbracket$

992

993 Inductive Case: Abstraction

994 $\lfloor \llbracket x\langle x \rangle.t | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor = \lambda x.\lfloor \llbracket t | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor \overset{\text{I.H.}}{=} \lambda x.\llbracket t | \sigma^\Lambda | \gamma \rrbracket = \llbracket x\langle x \rangle.t | \sigma^\Lambda | \gamma \rrbracket$

995

996 Inductive Case: Phantom-Abstraction

997 $\lfloor \llbracket c\langle x_1, \ldots, x_n \rangle.t | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor = \lambda c.\lfloor \llbracket t | \sigma_1^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor \overset{\text{I.H.}}{=} \lambda c.\llbracket x | \sigma_1^\Lambda | \gamma \rrbracket = \llbracket c\langle x_1, \ldots, x_n \rangle.t | \sigma^\Lambda | \gamma \rrbracket$

998 where

999 $\sigma_1^{\mathcal{W}} = \sigma[x_1 \mapsto \sigma(x_1)\{c/\gamma(c)\}, \ldots, x_n \mapsto \sigma(x_n)\{c/\gamma(c)\}]$

1000 $\sigma_1^\Lambda = \sigma[x_1 \mapsto \lfloor \sigma(x_1) \rfloor\{c/\gamma(c)\}, \ldots, x_n \mapsto \lfloor \sigma(x_n) \rfloor\{c/\gamma(c)\}]$

1001

1002 Inductive Case: Weakening

1003 $\lfloor \llbracket u[\leftarrow t] | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor = \lfloor \llbracket u | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor \overset{\text{I.H.}}{=} \llbracket u | \sigma^\Lambda | \gamma \rrbracket = \llbracket u[\leftarrow t] | \sigma^\Lambda | \gamma \rrbracket$

1004

1005 Inductive Case: Sharing

1006 $\lfloor \llbracket u[x_1, \ldots, x_n \leftarrow t] | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor = \lfloor \llbracket u | \sigma_1^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor \overset{\text{I.H.}}{=} \llbracket u | \sigma_1^\Lambda | \gamma \rrbracket = \llbracket u[x_1, \ldots, x_n \leftarrow t] | \sigma^\Lambda | \gamma \rrbracket$

1007 where

1008 $\sigma_1^{\mathcal{W}} = \sigma^{\mathcal{W}}[x_i \mapsto \llbracket t | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}}]_{1 \leq i \leq n}$

1009 $\sigma_1^\Lambda = \sigma^\Lambda[x_i \mapsto \lfloor \llbracket t | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor]_{1 \leq i \leq n} \overset{\text{I.H.}}{=} \sigma^\Lambda[x_i \mapsto \llbracket t | \sigma^\Lambda | \gamma \rrbracket]_{1 \leq i \leq n}$

1010

1011 Inductive Case: Distributor

1012 $\lfloor \llbracket u[e_1\langle \vec{w_1} \rangle, \ldots, e_m\langle \vec{w_m} \rangle | c\langle \vec{x} \rangle \overline{[\Gamma]}] | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor$

1013

1014 SubCase: $\vec{x} = c$

1015 $\lfloor \llbracket u[e_1\langle \vec{w_1} \rangle, \ldots, e_m\langle \vec{w_m} \rangle | c\langle c \rangle \overline{[\Gamma]}] | \sigma^{\mathcal{W}} | \gamma \rrbracket_{\mathcal{W}} \rfloor$

1016 $= \lfloor \llbracket u\overline{[\Gamma]} | \sigma | \gamma' \rrbracket_{\mathcal{W}} \rfloor \overset{\text{I.H.}}{=} \llbracket u\overline{[\Gamma]} | \sigma^\Lambda | \gamma' \rrbracket$

1017 $\quad = [\![\, u[e_1\langle \vec{w}_1 \rangle, \ldots, e_m\langle \vec{w}_m \rangle \,|\, c\langle c \rangle \overline{[\Gamma]}] \,|\, \sigma^\Lambda \,|\, \gamma \,]\!]$

1018

1019 $\qquad$ SubCase: $\vec{x} = x_1, \ldots, x_n$

1020 $\quad \lfloor [\![\, u[\underline{e_1\langle \vec{w}_1 \rangle}, \ldots, e_m\langle \vec{w}_m \rangle \,|\, \underline{c}\langle x_1, \ldots, x_n \rangle \overline{[\Gamma]}] \,|\, \sigma^{\mathcal{W}} \,|\, \gamma \,]\!]_{\mathcal{W}} \rfloor$

1021 $\quad \lfloor [\![\, u\overline{[\Gamma]} \,|\, \sigma_1^{\mathcal{W}} \,|\, \gamma' \,]\!]_{\mathcal{W}} \rfloor \overset{\text{I.H.}}{=} [\![\, u\overline{[\Gamma]} \,|\, \sigma_1^\Lambda \,|\, \gamma' \,]\!]$

1022 $\quad = [\![\, u[e_1\langle \vec{w}_1 \rangle, \ldots, e_m\langle \vec{w}_m \rangle \,|\, c\langle x_1, \ldots, x_n \rangle \overline{[\Gamma]}] \,|\, \sigma^\Lambda \,|\, \gamma \,]\!]$

1023 where

1024 $\quad \sigma_1^{\mathcal{W}} = \sigma[x_1 \mapsto \sigma(x_1)\{c/\gamma(c)\}, \ldots, x_n \mapsto \sigma(x_n)\{c/\gamma(c)\}]$

1025 $\quad \sigma_1^\Lambda = \sigma[x_1 \mapsto \lfloor \sigma(x_1) \rfloor\{c/\gamma(c)\}, \ldots, x_n \mapsto \lfloor \sigma(x_n) \rfloor\{c/\gamma(c)\}]$

1026

1027 We prove $[\![\, (\!| N |\!) \,]\!]^{\mathcal{W}} = (\!| N |\!)^{\mathcal{W}}$ by induction on N. We prove this statement by first prov-
1028 ing it for closed terms.

1029

1030 Base Case: Variable

1031 $\quad [\![\, (\!| x |\!)' \,]\!]^{\mathcal{W}} = [\![\, x \,]\!]^{\mathcal{W}} = x = (\!| x |\!)^{\mathcal{W}}$

1032

1033 Inductive Case: Application

1034 $\quad [\![\, (\!| M\,N |\!)' \,]\!]^{\mathcal{W}} = [\![\, (\!| M |\!)' \,]\!]^{\mathcal{W}} [\![\, (\!| N |\!)' \,]\!]^{\mathcal{W}} \overset{\text{I.H.}}{=} (\!| M |\!)^{\mathcal{W}} (\!| N |\!)^{\mathcal{W}} = (\!| M\,N |\!)^{\mathcal{W}}$

1035

1036 Inductive Case: Abstraction

1037 $\quad [\![\, (\!| \lambda x.M |\!)' \,]\!]^{\mathcal{W}}$

1038 $\qquad$ SubCase: $|M|_x = 0$

1039 $\quad = \lambda x.[\![\, (\!| M |\!)'[\leftarrow x] \,]\!]^{\mathcal{W}} = \lambda x.[\![\, (\!| M |\!)' \,]\!]^{\mathcal{W}}[\leftarrow x] \overset{\text{I.H.}}{=} \lambda x.(\!| M |\!)^{\mathcal{W}}[\leftarrow x] = (\!| \lambda x.M |\!)^{\mathcal{W}}$

1040

1041 $\qquad$ SubCase: $|M|_x = 1$

1042 $\quad = \lambda x.[\![\, (\!| M |\!)' \,]\!]^{\mathcal{W}} \overset{\text{I.H.}}{=} \lambda x.(\!| M |\!)^{\mathcal{W}} = (\!| \lambda x.M |\!)^{\mathcal{W}}$

1043

1044 $\qquad$ SubCase: $|M|_x = n > 1$

1045 $\quad = [\![\, (\!| M\frac{n}{x} |\!)'[x^1, \ldots, x^n \leftarrow x] \,]\!]^{\mathcal{W}} = [\![\, (\!| M\frac{n}{x} |\!)' \,|\, \sigma \,|\, I \,]\!]_{\mathcal{W}} \overset{\text{prop 40}}{=} [\![\, (\!| M\frac{n}{x} |\!)' \,]\!]^{\mathcal{W}}\{x/x_i\}_{1 \le i \le n}$

1046 $\quad \overset{\text{I.H.}}{=} (\!| M\frac{n}{x} |\!)^{\mathcal{W}}\{x/x_i\}_{1 \le i \le n} = (\!| M |\!)^{\mathcal{W}}$

1047

1048 Now that we have proven is works for closed terms, we can show the statement $[\![\, (\!| N |\!) \,]\!]^{\mathcal{W}} =$
1049 $(\!| N |\!)^{\mathcal{W}}$ holds

1050

1051 $\quad [\![\, (\!| N |\!) \,]\!]^{\mathcal{W}} = [\![\, (\!| N\frac{n_1}{x_1} \ldots \frac{n_k}{x_k} |\!)'[x_1^1, \ldots, x_1^{n_1} \leftarrow x_1] \ldots [x_k^1, \ldots, x_k^{n_k} \leftarrow x_k] \,]\!]^{\mathcal{W}}$

1052 $\quad \overset{\text{prop 40}}{=} [\![\, (\!| N\frac{n_1}{x_1} \ldots \frac{n_k}{x_k} |\!)' \,]\!]^{\mathcal{W}}\{x_i/x_i^j\}_{1 \le i \le k, 1 \le j \le n_i} = (\!| N\frac{n_1}{x_1} \ldots \frac{n_k}{x_k} |\!)^{\mathcal{W}}\{x_i/x_i^j\}_{1 \le i \le k, 1 \le j \le n_i} = (\!| N |\!)^{\mathcal{W}}$ $\quad \blacktriangleleft$

$\qquad$ We also discuss the proofs for Lemma 24 and Lemma 25. These are: Given $t \rightsquigarrow_\beta u$ then

$$[\![\, t \,]\!]^{\mathcal{W}} \rightarrow_\beta^+ [\![\, u \,]\!]^{\mathcal{W}}$$

and given $t \rightsquigarrow_{(C,D,L)} u$ and for any $x \in (t)_{bv} \cup (t)_{fp}$ and for all z, $x \notin (\sigma(z))_{fv}$.

$$[\![\, t \,|\, \sigma \,|\, \gamma \,]\!]_{\mathcal{W}} \rightarrow_{\mathcal{W}}^* [\![\, u \,|\, \sigma \,|\, \gamma \,]\!]_{\mathcal{W}}$$

1053 **Proof.** We prove this by induction. We first discuss all the case bases. $[\![\, (x\langle x \rangle.t)\,s \,]\!]^{\mathcal{W}} =$
1054 $(\lambda x.T)\,S = T\{S/x\} = [\![\, t\{s/x\} \,]\!]^{\mathcal{W}}$
$\quad$ where $T = [\![\, t \,]\!]^{\mathcal{W}}$ and $S = [\![\, s \,]\!]^{\mathcal{W}}$.

We prove this is true case-by-case, which is an extension of the proof for Lemma 16. Therefore,

we only show the interesting cases.

Case: (d_1)

$$u[\leftarrow s\,t] \rightsquigarrow_R u[\leftarrow s][\leftarrow t]$$

$[\![\,u[\leftarrow s\,t]\,|\,\sigma\,|\,\gamma\,]\!]_w = [\![\,u\,|\,\sigma\,|\,\gamma\,]\!]_w[\leftarrow [\![\,s\,|\,\sigma\,|\,\gamma\,]\!]_w\,[\![\,t\,|\,\sigma\,|\,\gamma\,]\!]_w]$
$\rightarrow_w [\![\,u\,|\,\sigma\,|\,\gamma\,]\!]_w[\leftarrow [\![\,s\,|\,\sigma\,|\,\gamma\,]\!]_w][\leftarrow [\![\,t\,|\,\sigma\,|\,\gamma\,]\!]_w] = [\![\,u[\leftarrow s][\leftarrow t]\,|\,\sigma\,|\,\gamma\,]\!]_w$

Case: (d_2)

$$u[\leftarrow c\langle \vec{x}\rangle.t] \rightsquigarrow_R u[\,|\,c\langle \vec{x}\rangle[\leftarrow t]]$$

$[\![\,u[\leftarrow c\langle \vec{x}\rangle.t]\,|\,\sigma\,|\,\gamma\,]\!]_w$

    SubCase: $\vec{x} = c$
    $[\![\,u[\leftarrow c\langle c\rangle.t]\,|\,\sigma\,|\,\gamma\,]\!]_w = [\![\,u\,|\,\sigma\,|\,\gamma\,]\!]_w[\leftarrow \lambda c.[\![\,t\,|\,\sigma\,|\,\gamma\,]\!]_w] \rightarrow_w [\![\,u\,|\,\sigma\,|\,\gamma\,]\!]_w[\leftarrow [\![\,t\,|\,\sigma\,|\,\gamma\,]\!]_w\{\bullet/c\}]$
    $\overset{\text{prop } 40}{=} [\![\,u[\leftarrow t]\,|\,\sigma'\,|\,\gamma\,]\!]_w = [\![\,u[\,|\,c\langle c\rangle[\leftarrow t]]\,|\,\sigma\,|\,\gamma\,]\!]_w$
    where $\sigma' = \sigma[c \mapsto \bullet]$

    SubCase: $\vec{x} = x_1, \ldots, x_n$
    $[\![\,u[\leftarrow c\langle x_1, \ldots, x_n\rangle.t]\,|\,\sigma\,|\,\gamma\,]\!]_w = [\![\,u\,|\,\sigma\,|\,\gamma\,]\!]_w[\leftarrow [\![\,c\langle x_1, \ldots, x_n\rangle.t\,|\,\sigma\,|\,\gamma\,]\!]_w]$
    $[\![\,u\,|\,\sigma\,|\,\gamma\,]\!]_w[\leftarrow \lambda c.[\![\,t\,|\,\sigma'\,|\,\gamma\,]\!]_w] \rightarrow_w [\![\,u\,|\,\sigma\,|\,\gamma\,]\!]_w[\leftarrow [\![\,t\,|\,\sigma'\,|\,\gamma\,]\!]_w\{\bullet/c\}]$
    $\overset{\text{prop } 40}{=} [\![\,u[\leftarrow t]\,|\,\sigma''\,|\,\gamma\,]\!]_w = [\![\,u[\,|\,c\langle x_1, \ldots, x_n\rangle[\leftarrow t]]\,|\,\sigma\,|\,\gamma\,]\!]_w$

Case: (d_3)

$$u[\,|\,c\langle c\rangle[\leftarrow c]] \rightsquigarrow_R u$$

$[\![\,u[\,|\,c\langle c\rangle[\leftarrow c]]\,|\,\sigma\,|\,\gamma\,]\!]_w = [\![\,u[\leftarrow c]\,|\,\sigma'\,|\,\gamma\,]\!]_w = [\![\,u\,|\,\sigma'\,|\,\gamma\,]\!]_w[\leftarrow \bullet]$
$= [\![\,u\,|\,\sigma\,|\,\gamma\,]\!]_w[\leftarrow \bullet] \rightarrow_w [\![\,u\,|\,\sigma\,|\,\gamma\,]\!]_w$

Case (c_2)

$$u[x \leftarrow t] \rightsquigarrow_C u\{t/x\}$$

$[\![\,u[x \leftarrow t]\,|\,\sigma\,|\,\gamma\,]\!]_w = [\![\,u\,|\,\sigma'\,|\,\gamma\,]\!]_w = [\![\,u\{t/x\}\,|\,\sigma\,|\,\gamma\,]\!]_w$
where
$\sigma' = \sigma[x \mapsto [\![\,t\,|\,\sigma\,|\,\gamma\,]\!]_w]$

For the remaining cases, we only show the cases for $[\![\,u[\leftarrow t]\,|\,\sigma\,|\,\gamma\,]\!]_w = [\![\,u\,|\,\sigma\,|\,\gamma\,]\!]_w[\leftarrow [\![\,t\,|\,\sigma\,|\,\gamma\,]\!]_w]$. The other cases are similar to those in the proof for Lemma 16.

Case: (l_1)

$$s[\leftarrow t]\,u \rightsquigarrow_L (s\,u)[\leftarrow t]$$

$[\![\,s[\leftarrow t]\,u\,|\,\sigma\,|\,\gamma\,]\!]_w = [\![\,s\,|\,\sigma\,|\,\gamma\,]\!]_w[\leftarrow [\![\,t\,|\,\sigma\,|\,\gamma\,]\!]_w]\,[\![\,u\,|\,\sigma\,|\,\gamma\,]\!]_w \rightarrow_w ([\![\,s\,|\,\sigma\,|\,\gamma\,]\!]_w\,[\![\,u\,|\,\sigma\,|\,\gamma\,]\!]_w)[\leftarrow [\![\,t\,|\,\sigma\,|\,\gamma\,]\!]_w]$
$[\![\,(s\,u)[\leftarrow t]\,|\,\sigma\,|\,\gamma\,]\!]_w$

The proofs for lifting past application (right) (l_2) and sharing (l_4) follow a similar argument so we choose to omit these cases

Case: (l_3)

$$d\langle \vec{x}\rangle.u[\leftarrow t] \rightsquigarrow_L (d\langle \vec{x}\rangle.u)[\leftarrow t] \text{ iff } \vec{x} \notin (t)_{fv}$$

SubCase: $\vec{x} = d$

$\llbracket d\langle d\rangle.u[\leftarrow t]\,|\,\sigma\,|\,\gamma\,\rrbracket_w = \lambda d.(\llbracket u\,|\,\sigma\,|\,\gamma\,\rrbracket_w[\leftarrow \llbracket t\,|\,\sigma\,|\,\gamma\,\rrbracket_w]) \to_w \lambda d.\llbracket u\,|\,\sigma\,|\,\gamma\,\rrbracket_w[\leftarrow \llbracket t\,|\,\sigma\,|\,\gamma\,\rrbracket_w]$

$= \llbracket (d\langle \vec{x}\rangle.u)[\leftarrow t]\,|\,\sigma\,|\,\gamma\,\rrbracket_w$

SubCase: $\vec{x} = x_1, \dots, x_n$

$\llbracket d\langle x_1, \dots, x_n\rangle.u[\leftarrow t]\,|\,\sigma\,|\,\gamma\,\rrbracket_w = \lambda d.(\llbracket u\,|\,\sigma'\,|\,\gamma\,\rrbracket_w[\leftarrow \llbracket t\,|\,\sigma'\,|\,\gamma\,\rrbracket_w])$

$\to_w \lambda d.\llbracket u\,|\,\sigma'\,|\,\gamma\,\rrbracket_w[\leftarrow \llbracket t\,|\,\sigma'\,|\,\gamma\,\rrbracket_w] = \llbracket (d\langle x_1, \dots, x_n\rangle.u)[\leftarrow t]\,|\,\sigma\,|\,\gamma\,\rrbracket_w$

Case: (l_5)

$$u[e_1\langle \vec{w}_1\rangle \dots e_n\langle \vec{w}_n\rangle\,|\,c\langle \vec{x}\rangle\overline{[\Gamma]}[\leftarrow t]] \rightsquigarrow_L$$

$$u[e_1\langle \vec{w}_1\rangle \dots e_n\langle \vec{w}_n\rangle\,|\,c\langle \vec{x}\rangle\,\overline{[\Gamma]}][\leftarrow t]$$

iff all $\vec{x} \notin (t)_{fv}$

$\llbracket u[e_1\langle \vec{w}_1\rangle \dots e_n\langle \vec{w}_n\rangle\,|\,c\langle \vec{x}\rangle\overline{[\Gamma]}[\leftarrow t]]\,|\,\sigma\,|\,\gamma\,\rrbracket_w$

Case: $\vec{x} = c$

$= \llbracket u\overline{[\Gamma]}[\leftarrow t]\,|\,\sigma\,|\,\gamma'\,\rrbracket_w = \llbracket u\overline{[\Gamma]}\,|\,\sigma\,|\,\gamma'\,\rrbracket_w[\leftarrow \llbracket t\,|\,\sigma\,|\,\gamma'\,\rrbracket_w]$

$= \llbracket u[e_1\langle \vec{w}_1\rangle \dots e_n\langle \vec{w}_n\rangle\,|\,c\langle c\rangle\overline{[\Gamma]}]\,|\,\sigma\,|\,\gamma\,\rrbracket_w[\leftarrow \llbracket t\,|\,\sigma\,|\,\gamma'\,\rrbracket_w]$

$= \llbracket u[e_1\langle \vec{w}_1\rangle \dots e_n\langle \vec{w}_n\rangle\,|\,c\langle c\rangle\overline{[\Gamma]}]\,|\,\sigma\,|\,\gamma\,\rrbracket_w[\leftarrow \llbracket t\,|\,\sigma\,|\,\gamma\,\rrbracket_w]$

$= \llbracket u[e_1\langle \vec{w}_1\rangle \dots e_n\langle \vec{w}_n\rangle\,|\,c\langle c\rangle\overline{[\Gamma]}][\leftarrow t]\,|\,\sigma\,|\,\gamma\,\rrbracket_w$

Case: $\vec{x} = x_1, \dots, x_n$

$= \llbracket u\overline{[\Gamma]}[\leftarrow t]\,|\,\sigma'\,|\,\gamma'\,\rrbracket_w = \llbracket u\overline{[\Gamma]}\,|\,\sigma'\,|\,\gamma'\,\rrbracket_w[\leftarrow \llbracket t\,|\,\sigma'\,|\,\gamma'\,\rrbracket_w]$

$= \llbracket u[e_1\langle \vec{w}_1\rangle \dots e_n\langle \vec{w}_n\rangle\,|\,c\langle x_1, \dots, x_n\rangle\overline{[\Gamma]}]\,|\,\sigma\,|\,\gamma\,\rrbracket_w[\leftarrow \llbracket t\,|\,\sigma'\,|\,\gamma'\,\rrbracket_w]$

$= \llbracket u[e_1\langle \vec{w}_1\rangle \dots e_n\langle \vec{w}_n\rangle\,|\,c\langle x_1, \dots, x_n\rangle\overline{[\Gamma]}]\,|\,\sigma\,|\,\gamma\,\rrbracket_w[\leftarrow \llbracket t\,|\,\sigma\,|\,\gamma\,\rrbracket_w]$

$= \llbracket u[e_1\langle \vec{w}_1\rangle \dots e_n\langle \vec{w}_n\rangle\,|\,c\langle x_1, \dots, x_n\rangle\overline{[\Gamma]}][\leftarrow t]\,|\,\sigma\,|\,\gamma\,\rrbracket_w$ ◀

B.1 Sharing Measure

We prove strong normalisation of sharing reductions through the use of *multisets*. Intuitively, a multiset can be interpreted as a set where elements can be repeated, or equivalently as lists that are considered equal up to the permutation of elements. We use multisets to measure aspects of a term, and show that these aspects strictly decrease via $\rightsquigarrow_{(R,D,L)}$ reduction.

▶ **Definition 41** (Multisets). *A multiset m is a pair (A, f) where A is a set and $f : A \to \mathcal{N}$ is a function that maps elements of A to a natural number.*

The formal definition of multisets in Definition 41 follows intuition when we consider the function f to tell us the number of occurrences of an element $x \in A$ in the multiset m.

▶ **Example 42.** Let $m = (\{x, y, z\}, f)$ and $f(x) = 2$, $f(y) = 1$ and $f(z) = 3$. Then this multiset can also be written as $\{x, x, y, z, z, z\}$ or equivalently as $\{x^2, y^1, z^3\}$

▶ Remark 43. The empty multiset is written as $\{\}$

We will need to be able to reason about multisets in order to use them as part of our reasoning for strong normalisation. First we discuss the union of multisets, which will be needed when measuring a term recursively, e.g. in an application $s\,t$ we will need to measure aspects of s and unionise them with the multiset corresponding to the measure of the same of t, to obtain the overall measure of the application.

▶ **Definition 44** (Union of Multisets). *The* union *(or* sum*) of two multisets $m = (A, f)$ and $n = (B, g)$ is the multiset $m \cup n = (A \cup B, h)$ such that for all $x \in A \cup B$, $h(x) = f(x) + g(x)$.*

▶ **Example 45.** Let $m = \{a^1, b^3, c^2\}$ and $n = \{c^3, d^1\}$, then $m \uplus n = \{a^1, b^3, c^5, d^1\}$

▶ Remark 46. The notion $A \cup B$ is the union of the sets and *not* a disjoint union.

To show strong normalisation of sharing reductions, we need to show that aspects of terms that can be represented as multisets strictly decrease during reduction. In order to show this, we need to be able determine when a multiset is larger/smaller than another i.e. we need to be able to apply an ordering.

▶ **Definition 47** (Ordering of Multisets). *Given a totally ordered set A and two multisets $m = (A, f)$ and $n = (A, g)$, we say m is strictly larger than n, $m > n$, if the following conditions hold*

- $m \neq n$
- $\forall x \in A.(g(x) > f(x) \to \exists y \in A.[(y > x) \land (f(y) > g(y))])$

▶ **Example 48.** $\{1^5, 2^2, 3^1\} < \{1^3, 2^4, 3^3\}$

The *height* of a term is intuitively a multiset of integers that record the scope of each sharing. The scope is measured by the number of constructors from the sharing node to the root of the term in its graphical notation. The formal definition of the height is given in Definition 32. First we prove Lemma 27 on a case-by-case basis.

If $t \rightsquigarrow_{(L)} u$ then $\mathcal{H}^i(t) > \mathcal{H}^i(u)$

Proof.

$$s[\Gamma]\, t \rightsquigarrow_L (s\, t)[\Gamma]$$

$\mathcal{H}^i((s[\Gamma])\, t) = \mathcal{H}^{i+1}(s[\Gamma]) \uplus \mathcal{H}^{i+1}(t) = \mathcal{H}^{i+1}(s) \uplus \mathcal{H}^{i+1}(t) \uplus \mathcal{H}^{i+1}([\Gamma]) \uplus \{i+1\}$
$\mathcal{H}^i((s\, t)[\Gamma]) = \mathcal{H}^i(s\, t) \uplus \mathcal{H}^i([\Gamma]) = \mathcal{H}^{i+1}(s) \uplus \mathcal{H}^{i+1}(t) \uplus \mathcal{H}^i([\Gamma]) \uplus \{i\}$

$$s\, t[\Gamma] \rightsquigarrow_L (s\, t)[\Gamma]$$

This case is similar to the one above and we omit it.

$$d\langle \vec{x} \rangle.t[\Gamma] \rightsquigarrow_L (d\langle \vec{x} \rangle.t)[\Gamma] \text{ iff all } \vec{x} \in (t)_{fv}$$

$\mathcal{H}^i(c\langle \vec{x} \rangle.t[\Gamma]) = \mathcal{H}^{i+1}(t[\Gamma]) = \mathcal{H}^{i+1}(t) \uplus \mathcal{H}^{i+1}([\Gamma]) \uplus \{i+1\}$
$\mathcal{H}^i((c\langle \vec{x} \rangle.t)[\Gamma]) = \mathcal{H}^i(c\langle \vec{x} \rangle.t) \uplus \mathcal{H}^i([\Gamma]) \uplus \{i\} = \mathcal{H}^{i+1}(t) \uplus \mathcal{H}^i([\Gamma]) \uplus \{i\}$

$$u[\vec{x} \leftarrow t[\Gamma]] \rightsquigarrow_L u[\vec{x} \leftarrow t][\Gamma]$$

$\mathcal{H}^i(u[\vec{x} \leftarrow t[\Gamma]]) = \mathcal{H}^i(u) \uplus \mathcal{H}^i([\vec{x} \leftarrow t[\Gamma]]) \uplus \{i\} = \mathcal{H}^i(u) \uplus \mathcal{H}^{i+1}(t) \uplus \mathcal{H}^{i+1}([\Gamma]) \uplus \{i, i+1\}$

The *weight* of a term is intuitively the number or copies each constructor (abstraction, application and variable) will exist after duplication. Figure 3 illustrates this, by showing a side-by-side comparison of the term

$$x\langle x\rangle.c_1\langle w_1\rangle.w_1\,((c_2\langle w_2\rangle.w_2)\,x)$$

$$[c_1\langle w_1\rangle c_2\langle w_2\rangle \,|\, y\langle y\rangle \,[w_1, w_2 \leftarrow z\langle z\rangle.z_1\,(z_2\,y)[z_1, z_2 \leftarrow z]]]$$

1117 and its equivalent in the $\Lambda_\mathcal{W}$-calculus obtained by $[\![-]\!]^\mathcal{W}$. Each red line shows the connection
1118 between the abstraction and application constructors in both calculi. The weight of a
1119 constructor is then the number of red lines associated with it, e.g. the weight of the example
1120 is the multiset $\{1^6, 2^4, 4^1\}$.

1121 ▶ **Proposition 49.** *For $e \notin \vec{w}$, $\mathcal{W}^i(t) = \mathcal{W}^i(t\{\vec{w}/e\}_b)$*

1122 **Proof.** To prove this, first we need to prove that book-keeping does not affect the function
1123 $\mathcal{V}^i(t)$. We prove this by induction on t.
1124 Base Case: Variable
1125 Vacuously True
1126
1127 Base Case: Abstraction
1128 $\mathcal{V}^i(e\langle \vec{y}\rangle.t\{\vec{w}/e\}_b) = \mathcal{V}^i(e\langle \vec{w}\rangle.t) = \mathcal{V}^i(t) \cup \{e \mapsto i\} = \mathcal{V}^i(e\langle \vec{y}\rangle.t)$
1129
1130 Base Case: Distributor
1131 $\mathcal{V}^i(u[\overrightarrow{f\langle \vec{z}\rangle} \,|\, e\langle \vec{y}\rangle \overline{[\Gamma]}]\{\vec{w}/e\}_b) = \mathcal{V}^i(u[\overrightarrow{f\langle \vec{z}\rangle} \,|\, e\langle \vec{w}\rangle \overline{[\Gamma]}])$
1132 $= \mathcal{V}^i(u\overline{[\Gamma]})\,\{\vec{e}\} = \mathcal{V}^i(u[\overrightarrow{f\langle \vec{z}\rangle} \,|\, e\langle \vec{y}\rangle \overline{[\Gamma]}])$
1133
1134 Inductive Case: Application
1135 $\mathcal{V}^i(s\,t\{\vec{w}/e\}_b) = \mathcal{V}^i((s\{\vec{w}/e\}_b)\,t\{\vec{w}/e\}_b) = \mathcal{V}^i(s\{\vec{w}/e\}_b) \cup \mathcal{V}^i(t\{\vec{w}/e\}_b) \overset{\text{I.H.}^2}{=} \mathcal{V}^i(s) \cup \mathcal{V}^i(t) =$
1136 $\mathcal{V}^i(s\,t)$

Figure 3 The weight is the multiset of incoming red arcs for each application and abstraction; here $\{1^5, 2^3\}$, together with the number of purple dotted lines for each variable; here $\{1, 2, 4\}$. Thus the overall weight is $\{1^6, 2^4, 4\}$

$= \mathcal{W}^i(u) \cup \mathcal{W}^j(t) \cup \{\mathcal{V}^i(u)(x_1),\ldots,\mathcal{V}^i(u)(x_n),\mathcal{V}^j(t)(c)\}$

Case: 2
$\mathcal{W}^i(u[x_1,\ldots,x_n \leftarrow c\langle \vec{y}\rangle.t]) = \mathcal{W}^i(u) \cup \mathcal{W}^j(c\langle \vec{y}\rangle.t) = \mathcal{W}^i(u) \cup \mathcal{W}^j(t) \cup \{j\}$
where $j = \mathcal{V}^i(u)(x_1) + \cdots + \mathcal{V}^i(u)(x_n)$
$\mathcal{W}^i(u\{e_i\langle w_1^i\rangle.w_1^i/x_i\}_{1\le i\le n}[e_1\langle w_1^1\rangle\ldots e_n\langle w_1^n\rangle\,|\,c\langle \vec{y}\rangle\,[w_1^1,\ldots,w_1^n \leftarrow t]])$
$= \mathcal{W}^i(u\{e_i\langle w_1^i\rangle.w_1^i/x_i\}_{1\le i\le n}[w_1^1,\ldots,w_1^n \leftarrow t])$
$= \mathcal{W}^i(u\{e_i\langle w_1^i\rangle.w_1^i/x_i\}_{1\le i\le n}) \cup \mathcal{W}^k(t)$
where $k = \mathcal{V}^i(u\{e_i\langle w_1^i\rangle.w_1^i/x_i\}_{1\le i\le n})(w_1^1) + \cdots + \mathcal{V}^i(u\{e_i\langle w_1^i\rangle.w_1^i/x_i\}_{1\le i\le n})(w_1^n) = j$
$= \mathcal{W}^i(u\{e_i\langle w_1^i\rangle.w_1^i/x_i\}_{1\le i\le n}) \cup \mathcal{W}^j(t)$
$= \mathcal{W}^i(u) \cup \mathcal{W}^j(t) \cup \{\mathcal{V}^i(u)(x_1),\ldots,\mathcal{V}^i(u)(x_n)\}$

$$u[e_1\langle \vec{w_1}\rangle\ldots e_n\langle \vec{w_n}\rangle\,|\,c\langle c\rangle\,[\vec{w_1},\ldots,\vec{w_n} \leftarrow c]] \rightsquigarrow_D u\{e_1\langle \vec{w_1}\rangle\}_e\ldots\{e_n\langle \vec{w_n}\rangle\}_e$$

$\mathcal{W}^i(u[e_1\langle \vec{w_1}\rangle\ldots e_n\langle \vec{w_n}\rangle\,|\,c\langle c\rangle\,[\vec{w_1},\ldots,\vec{w_n} \leftarrow c]])$
$= \mathcal{W}^i(u[\vec{w_1},\ldots,\vec{w_n} \leftarrow c]) \cup \{\mathcal{V}^i(u[\vec{w_1},\ldots,\vec{w_n} \leftarrow c](c))\}$
$= \mathcal{W}^i(u) \cup \{\} \cup \{j\}$

where $j = \mathcal{V}^i(u)(\vec{w_1}) + \cdots + \mathcal{V}^i(u)(\vec{w_n})$

$\mathcal{W}^i(u\{e_1\langle \vec{w_1} \rangle\}_e \ldots \{e_n\langle \vec{w_n} \rangle\}_e) = \mathcal{W}^i(u) \uplus \{\mathcal{V}^i(u)(\vec{w_1}), \ldots, \mathcal{V}^i(u)(\vec{w_n})\}$

where $\mathcal{V}^i(u)(\vec{w}) = \mathcal{V}^i(u)(w_1) + \cdots + \mathcal{V}^i(u)(w_n)$ and $\vec{w} = \{w_1, \ldots, w_n\}$

Lifting and Compound

$$u[\vec{w} \leftarrow y][\vec{x} \cdot y \leftarrow t] \rightsquigarrow_C u[\vec{x} \cdot \vec{w} \leftarrow t]$$

$\mathcal{W}^i(u[\vec{w} \leftarrow y][\vec{x} \cdot y \leftarrow t]) = \mathcal{W}^i(u[\vec{w} \leftarrow y]) \uplus \mathcal{W}^j(t)$

where $j = \mathcal{V}^i(u[\vec{w} \leftarrow y])(\vec{x}) + \mathcal{V}^i(u[\vec{w} \leftarrow y])(y) = \mathcal{V}^i(u[\vec{w} \leftarrow y])(\vec{x}) + \mathcal{V}^i(u)(\vec{w})$

$= \mathcal{W}^i(u) \uplus \mathcal{W}^j(t) = \mathcal{W}^i(u[\vec{x} \cdot \vec{w} \leftarrow t])$

$$u[x \leftarrow t] \rightsquigarrow_C u\{t/x\}$$

1206 $\mathcal{W}^i(u[x \leftarrow t]) = \mathcal{W}^i(u) \uplus \mathcal{W}^j(t)$

1207 where $j = \mathcal{V}^i(u)(x)$

1208 $\mathcal{W}^i(u\{t/x\}) = \mathcal{W}^i(u) \uplus \mathcal{W}^{\mathcal{V}^i(u)(x)}(t)$

1209

1210 For the other lifting rules, we show that $\mathcal{V}^i(u[\Gamma])$ outputs the same integers before and after

1211 lifting for each variable bounded by $[\Gamma]$. Then we can know it produces some multiset M.

$$(s[\Gamma]) \, t \rightsquigarrow_L (s \, t)[\Gamma]$$

$\mathcal{W}^i((s[\Gamma]) \, t) = \mathcal{W}^i(s[\Gamma]) \uplus \mathcal{W}^i(t) = \mathcal{W}^i(s) \uplus \mathcal{W}^i(t) \uplus M_1$

$\mathcal{W}^i((s \, t)[\Gamma]) = \mathcal{W}^i(s \, t) \uplus M_2 = \mathcal{W}^i(s) \uplus \mathcal{W}^i(t) \uplus M_2$

$M_1 = M_2$ since $\mathcal{V}^i(s)(x) = \mathcal{V}^i(s \, t)(x)$ for $x \in (s)_{fv}$ and $[\Gamma]$ only binds variables in s.

$$s \, t[\Gamma] \rightsquigarrow_L (s \, t)[\Gamma]$$

This case is very similar to the one above and we omit it.

$$d\langle \vec{x} \rangle.t[\Gamma] \rightsquigarrow_L (d\langle \vec{x} \rangle.t)[\Gamma] \text{ iff all } \vec{x} \in (t)_{fv}$$

Case 1:

$\mathcal{W}^i(d\langle d \rangle.(t[\Gamma])) = \mathcal{W}^i(t[\Gamma]) \uplus \{i, \mathcal{V}^i(t[\Gamma])(d)\} = \mathcal{W}^i(t) \uplus M_1 \uplus \{i, \mathcal{V}^i(t)(d)\}$

$\mathcal{W}^i((d\langle d \rangle.t)[\Gamma]) = \mathcal{W}^i(d\langle d \rangle.t) \uplus M_2 = \mathcal{W}^i(t) \uplus M_2 \uplus \{i, \mathcal{V}^i(t)(d)\}$

$M_1 = M_2$ since $\mathcal{V}^i(t)(x) = \mathcal{W}^i(d\langle d \rangle.t)(x)$ where $x \neq d$ and d is not bound by $[\Gamma]$

Case 2:

$\mathcal{W}^i(d\langle \vec{x} \rangle.(t[\sigma])) = \mathcal{W}^i(t[\sigma]) \uplus \{i\} = \mathcal{W}^i(t) \uplus M_1 \uplus \{i\}$

$\mathcal{W}^i((d\langle \vec{x} \rangle.t)[\sigma]) = \mathcal{W}^i(d\langle \vec{x} \rangle.t) \uplus M_2 = \mathcal{W}^i(t) \uplus M_2 \uplus \{i\}$

$M_1 = M_2$ since $\mathcal{V}^i(t)(x) = \mathcal{W}^i(d\langle \vec{x} \rangle.t)(x)$ where $x \neq d$ and d is not bound by $[\Gamma]$

$$u[\vec{x} \leftarrow t[\Gamma]] \rightsquigarrow_L u[\vec{x} \leftarrow t][\Gamma]$$

Case 1:

$\mathcal{W}^i(u[\vec{x} \leftarrow t[\Gamma]]) = \mathcal{W}^i(u) \uplus \mathcal{W}^j(t[\Gamma]) = \mathcal{W}^i(u) \uplus \mathcal{W}^j(t) \uplus M_1$

where $j = \mathcal{V}^i(u)(x_1) + \cdots + \mathcal{V}^i(u)(x_n)$

$\mathcal{W}^i(u[\vec{x} \leftarrow t][\Gamma]) = \mathcal{W}^i(u[\vec{x} \leftarrow t]) \uplus M_2 = \mathcal{W}^i(u) \uplus \mathcal{W}^j(t) \uplus M_2$

$M_1 = M_2$ since $\mathcal{V}^j(t)(x) = \mathcal{V}^i(u[\vec{x} \leftarrow t])(x)$ for $x \in (t)_{fv}$ and $[\Gamma]$ only binds variables in t

Case 2:

$\mathcal{W}^i(u[\leftarrow t[\Gamma]]) = \mathcal{W}^i(u) \uplus \mathcal{W}^1(t[\Gamma]) = \mathcal{W}^i(u) \uplus \mathcal{W}^1(t) \uplus M_1$

$\mathcal{W}^i(u[\leftarrow t][\Gamma]) = \mathcal{W}^i(u[\leftarrow t]) \uplus M_2 = \mathcal{W}^i(u) \uplus \mathcal{W}^1(t) \uplus M_2$

$M_1 = M_2$ since $\mathcal{V}^1(t)(x) = \mathcal{V}^i(u[\leftarrow t])(x)$ for $x \in (t)_{fv}$ and $[\Gamma]$ only binds variables in t

$$u[e_1\langle \vec{w_1} \rangle \dots e_n\langle \vec{w_n} \rangle | c\langle \vec{x} \rangle \overline{[\Gamma]}[\vec{y} \leftarrow t]] \rightsquigarrow_L$$

$$u\{(\vec{w_1}/\vec{y})/e_1\}_b \dots \{(\vec{w_n}/\vec{y})/e_n\}_b [e_1\langle \vec{w_1}/\vec{y} \rangle \dots e_n\langle \vec{w_n}/\vec{y} \rangle | c\langle \vec{x} \rangle \overline{[\Gamma]}][\vec{y} \leftarrow t]$$

$$u[e_1\langle \vec{w_1} \rangle \dots e_n\langle \vec{w_n} \rangle | c\langle \vec{x} \rangle \overline{[\Gamma]}[\overrightarrow{f\langle \vec{z} \rangle} | d\langle \vec{a} \rangle \overline{[\Gamma']}]] \rightsquigarrow_L$$

$$u\{(\vec{w_1}/\vec{z})/e_1\}_b \dots \{(\vec{w_n}/\vec{z})/e_n\}_b [e_1\langle \vec{w_1}/\vec{z} \rangle \dots e_n\langle \vec{w_n}/\vec{z} \rangle | c\langle \vec{x} \rangle \overline{[\Gamma]}[\overrightarrow{f\langle \vec{z} \rangle} | d\langle \vec{a} \rangle \overline{[\Gamma']}]]$$

Since book-keeping operations do not affect the weight of a term (Proposition 49), we simplify these two rules into one, where u' is u with some book-keepings applied.

Note: Proposition 49 is relevant here since the book-keepings produced by this rule cannot be of the form $\{e/e\}_b$ without breaking linearity.

$$u[e_1\langle \vec{w_1} \rangle \dots e_n\langle \vec{w_n} \rangle | c\langle \vec{x} \rangle \overline{[\Gamma]}[\Gamma]] \rightsquigarrow_L u'[e_1\langle \vec{z_1} \rangle \dots e_n\langle \vec{z_1} \rangle | c\langle \vec{x} \rangle \overline{[\Gamma]}][\Gamma]$$

1212   Case 1:

1213 $\mathcal{W}^i(u[e_1\langle \vec{w_1} \rangle \dots e_n\langle \vec{w_n} \rangle | c\langle c \rangle \overline{[\Gamma]}[\Gamma]]) = \mathcal{W}^i(u\overline{[\Gamma]}[\Gamma]) \uplus \{\mathcal{V}^i(u\overline{[\Gamma]}[\Gamma](c))\}$

1214 $= \mathcal{W}^i(u\overline{[\Gamma]}) \uplus M_1 \uplus \{\mathcal{V}^i(u\overline{[\Gamma]}[\Gamma](c))\}$

1215 $\mathcal{W}^i(u'[e_1\langle \vec{z_1} \rangle \dots e_n\langle \vec{z_1} \rangle | c\langle c \rangle \overline{[\Gamma]}][\Gamma]) = \mathcal{W}^i(u'[e_1\langle \vec{z_1} \rangle \dots e_n\langle \vec{z_1} \rangle | c\langle c \rangle \overline{[\Gamma]}]) \uplus M_2$

1216 $= \mathcal{W}^i(u'[\Gamma]) \uplus M_2 \uplus \{\mathcal{V}^i(u[\Gamma])(c)\}$

1217 $M_1 = M_2$ since $\mathcal{V}^i(u\overline{[\Gamma]})(x) = \mathcal{V}^i(u'[e_1\langle \vec{z_1} \rangle \dots e_n\langle \vec{z_1} \rangle | c\langle c \rangle \overline{[\Gamma]}])(x)$

1218   for $x \in (u\overline{[\Gamma]}/\{c, e_1, \dots, e_n\})_{fv}$ and the variables $c, e_1, \dots, e_n$ are not bound by $[\Gamma]$

1219 $\{\mathcal{V}^i(u\overline{[\Gamma]}[\Gamma])(c)\} = \{\mathcal{V}^i(u\overline{[\Gamma]})(c)\}$ since $c \in (\overline{[\Gamma]})_{fv}$ and $\mathcal{V}^i(u\overline{[\Gamma]}[\Gamma]) = \mathcal{V}^i(u\overline{[\Gamma]}) \uplus \mathcal{V}^j([\Gamma])$.

1220   Case 2:

1221 $\mathcal{W}^i(u[e_1\langle \vec{w_1} \rangle \dots e_n\langle \vec{w_n} \rangle | c\langle \vec{x} \rangle \overline{[\Gamma]}[\Gamma]]) = \mathcal{W}^i(u\overline{[\Gamma]}[\Gamma]) = \mathcal{W}^i(u\overline{[\Gamma]}) \uplus M_1$

1222 $\mathcal{W}^i(u'[e_1\langle \vec{z_1} \rangle \dots e_n\langle \vec{z_1} \rangle | c\langle \vec{x} \rangle \overline{[\Gamma]}][\Gamma]) = \mathcal{W}^i(u'[e_1\langle \vec{z_1} \rangle \dots e_n\langle \vec{z_1} \rangle | c\langle \vec{x} \rangle \overline{[\Gamma]}]) \uplus M_2$

1223 $= \mathcal{W}^i(u'\overline{[\Gamma]}) \uplus M_2$

1224 $M_1 = M_2$ since $\mathcal{V}^i(u\overline{[\Gamma]})(x) = \mathcal{V}^i(u'[e_1\langle \vec{z_1} \rangle \dots e_n\langle \vec{z_1} \rangle | c\langle c \rangle \overline{[\Gamma]}])(x)$

1225   for $x \in (u\overline{[\Gamma]}/\{c, e_1, \dots, e_n\})_{fv}$ and the variables $c, e_1, \dots, e_n$ are not bound by $[\Gamma]$ ◀
